PREFACE TO THE 64¹⁸ ANNUAL VOLUME.

The formation of the National Government and the subsequent General Election leve brought about many changes in the sixty-fourth annual issue of "Whitaker," published early in December in order that it may be available for transmission overseas before the end of the year. The Cabinet as finally reconstructed and the new House of Commons are included, together with articles on the Financial Crisis and Government by Party, with a tabular record of Administrations from Pitt to MacDonald. Statistical Tables are also provided to show the source of the World's Food and other Products, and the quantities and places of origin of Great Britain's Food Imports.

The preleannary results of the Census of Lugland, Wales and Monmouth and of Scotland are duly recorded, with similar figures for the Indian Empire, the Union of South Mirica, and for Dominions where the taking of the Census was not postponed on economical grounds. Final figures for last year's Census of the United States are also provided, but the results of the commerciation in Canada are not yet available.

Questions of the Day are again treated in separate articles ranging in alphabetical sequence from "Allotinents for Unemployed to "The Weir Report." These are followed by Annual Summaries of The Year's Weather, Storms, Ploods, Science and Invention, Laterature, Art. Music. Drama, The Films, and Broadcasting

In order that the varied contents may be available for instant reference, the Index has again been enlarged and now consists of 140 columns, containing apwards of 20,000 references.

Many suggestions made by correspondents have been adopted, but in some cases action was delayed by pressure due to the political situation, and the consequent change or addition had perforce to be postponed. The Editor-m-Chief is deeply grateful to his collaborators for their valuable assistance during the past year and hopes the result of their co-operation will encourage them to continue the work of preserving and increasing the usefulness of a book which has become so familiar to all who read or speak the language in which it is printed.

Correspondents are carnestly requested to note the first day of October as the last day for suggestions to reach the Office, at the address given below.

The Hottingham Guardian

circulates in every part of a busy area, containing a

Population of over 2,500,000

engaged in the LACE, HOSIERY, BOOT and SHOE, ENGINEERING, CHEMICAL, TOBACCO, MOTOR CYCLE, COAL MINING, IRON and AGRICULTURAL INDUSTRIES, in the five counties of Nottinghamshire, Derbyshire, Leicestershire, Lincolnshire and Rutland.

The Nottingham Guardian

maintains an active, efficient, and thoroughly up-to-date

TRADE INTELLIGENCE BUREAU

the value and practical utility of which to manufacturers and business men, at home and overseas, is proved by the thousands of inquiries that are dealt with every year.

Inquirers may obtain from the Secretary of the Bureau "Nottingham Guardian," Nottingham:

Particulars of trade marks and branded goods. Introductions to manufacturers & buyers in every trade.

The Bureau works reciprocally with all the leading Trade, Government, and Commercial organisations in all parts of the world.

ITS SERVICES ARE ENTIRELY FREE.

London Office: 67 Flect Street, E.C.4.

THE BURBERRY BOOK

tells many things you ought to know about The Burberry—the world's best Weatherproof and one of the world's best Overcoats. A copy, with patterns of cloths and prices, post free on mention of "Whitaker's Almanack."

Don't

worry about the weather

wear THE BURBERRY and be dry and comfortable whatever happens.

THE BURBERRY provides perfect protection in every kind of weather; supplies everything you ask of a Weatherproof or of an Overcoat.

It keeps one dry when it rains and warm when it's cold. It's a staunch shield against bitter winds, yet (and this is very important), airylight and naturally ventilating, the coolest and most comfortable top-coat for warm days.

wear

THE BURBERRY

and be

dry & comfortable whatever happens

THE COCKTAIL HABIT

T is a point of fact (and facts—the hardest possible—are the only things the present generation can be expected to take seriously) that Alcohol and its disabilities are no longer exclusively the province of In the days when "drink." to use that vulgar but convenient term, meant heavy wines, brandy, whisky, and the coarser spirits, there was very little temptation for women to indulge in it. But things are very different now. Europe has become "cocktailised," and there is, unfortunately, no form of Alcohol more dangerous and at the same time more adapted to the feminine palate.

A cocktail is a strong pick-me-up; it has approximately the effect of a glass of champagne; and it is drink which can be taken at almost any hour. Can anything more tempting, more seductive, and, though she probably does not realise it, more intensely demoralising to the woman of to-day, with her arduous and multifarious duties, be imagined?

THE COCKTAIL HABIT IS THE EASIEST IN THE WORLD TO SLIP INTO.

You are tired after a long day -- a couple of cocktails help you to shine at dinner, may also make a dull lunch bearable; they also . . . but why enumerate? Taken at regular intervals like medicine (and that is the way they are consumed by a multitude of men and women), they perform their extraordinary task of getting you through the day." In time you come to rely upon them . . . but, of course, you tell yourself, it is only during the season, or while you are so busy; you can always give them up. You try to do so—and you cannot. You try again. You are miserable, low, depressed, as you yourself admit, "not fit to speak to," and in ninety-nine cases out of a hundred you again give in. It is inevitable, for the alcoholic habit is scarcely ever broken unaided. Circumstances are too much against it. But if, when you first realised your addiction to this-or any otherform of stimulant, you consulted the Turvey Treatment Association, all your worry, depression, the worst of all human ills, and general unhappiness would be cured—and cured quickly. Instead of struggling vainly and unsuccessfully, you would be able to regard your temporary bondage as an evil dream from which The Turvey vou have awoken. Treatment necessitates neither nursing homes, doctors, nor injectionsnothing which could conceivably interfere with the ordinary course of life.

The following inquiry form may be filled in and forwarded (or a letter written), on receipt of which full particulars and advice will be forwarded under plain cover.

TEAR OFF AND POST.......
Confidential.

To the MEDICAL SUPT. BRITISH T.T. ASSOCIATION.

HANOVER HOUSE.

14 HANOVER SQUARE, LONDON, W.1

(Entrance, Harewood Place.) Telephone: Mayfair 3406 (2 lines). Telegrams: Turvert, Wesdo, London.

Please forward me by return, under plain cover, full particulars and advice as referred to in WHITAKER'S ALMANACK.

Name

Address.....

PERSONAL CONSULTATION.

When a personal interview is desired, this voucher may be detached and presented at the Consulting Rooms of the Turvey Treatment Association, 14, Hanover Square, London, W. 1. (Entrance, Harewood Place.)

Name or Initials

Hours from 10 till 5.30. Saturdays, 10 till 1. (Special appointments may be made by phone or post; no charge for consultation personally or by letter.)

ROYAL SOCIETY MEDALS, 1931.

The King has approved of the following F.R.S., for his distinguished researches in optics awards by the President and Council of the and terrestrial magnetism Royal Society :-

A Royal Medal to Sir Richard Glazebrook, K.C.B., F.R S., for his distinguished work in experimental physics

A Royal Medal to Professor W H. Lang, F R.S. for his work on the anatomy and morphology of the fern-like fossils of the Old Red Sandstone.

The following awards have also been made :-

The Conley Medal to Sir Arthur Schuster, structure by X-ray analysis

The Davy Medal to Professor A. Lapworth. FRY, for his researches in organic chemistry, particularly those in connexion with tautomerism and the mechanism of organic reactions.

The Sylvester Medal to Professor E. T. Whittaker, F.R.9, for his original contributions to both pure and applied mathematics

The Hughes Medal to Professor W. L. Bragg for his pioneer work on the elucidation of crystal

THE COLLEGE OF ESTATE MANAGEMEN

(Incorporated by Royal Charter)

35. Lincoln's Inn Fields. London, W.C.2.

Complete Courses of Preparation for the Examinations of

CHARTERED SURVEYORS' INSTITUTION.

Students are prepared by whole-day tuition at the College or in Evening Classes, or by Postal Tuition.

GOLD MEDAL LAST YEAR WAS WON BY A COLLEGE STUDENT. Apply, THE REGISTRAR.

WORLD PRODUCTIONS.

(Latest returns by Countries officially recording.)

BRITISH BEET SUGAR.

The production of Beet for Sugar in England and Wales from small beginnings around the year 183s has now grown to an area of 348,000 acres farmed by 40,000 growers, producing in 1930 3,050,000 tons of Beet (washed weight) fetching an average price to the grower of 50s. per ton delivered factory. Eighteen factories thus produce 420,000 tons of sugar and employ 9,000 workmen for over 100 days of the year in addition to the product of the second of the search of the second of the search of the second of the search of workmen for over 100 days or the year in addition to about 30,000 workers employed in the fields (part time, about 4 months in the year). The dried pulp residue fetched in 1930 30 about £650 000 and the trading profit to the factories, after paying £673,000. The subsidy paid by the Government £1,738,000. The subsidy paid by the Government in 1929 amounted to £4,233,776 and for 1930 was estimated at £6,139,000.

Great Britain and Northern Ireland consume per annum a total of 1,850,000 tons of Sugar, or golb. per head of population.

Notes on Time Numeration: Tables of the Moon, &c.—According to the practice of recent years, the day as treated in this Almanack is divided into a4 hours, numbered from e to a3, the hour following the midnight which begins the day being called c. This system, formerly known as G.C.T., was adopted for astronomical purposes in rags and is now indicated by the initials G.M.T., U.T. (Universal Time), or W.Z. (Weltzeit), according to choice.

The attempt has been made by astronomers to have this system used in rallway time-tables, but the authorities will not agree to this unless the a4-hour system is adopted nationally. A proposal that this should be done was brought before the House of Lords, ineffectually, last year. On page 3 of each month the position of the Moon, and other details relating thereto, are given for the midnight which ends the day specified in the first column. The second column gives the

MORNING AND EVENING STARS

- MERCURY being at Greatest Western elongation
 on January 12th is a morning star and will be low
 down in the south-east at 7 o'clock in the first fortnight of the month.
- VENUS is an evening star and may be seen soon after sunset not very high in the south-west sky
- of MARS in conjunction with the Sun on February 1st is not visible either in the morning or evening sky.
- JUPITER is a conspicuous object almost throughout the night. It is moving slowly westward not far from Regulus and rises in the E.N.E. an hour or two after sunset. Magnitude -2°0 to -2 x
- b SATURN being in conjunction on the 16th rises and sets nearly with the "an throughout the month and will not be seen.

 time of the rising which happens during that day, and the figures in the two following columns show the time of the southing and of the setting which next tollow that rising, and these sometimes happen after the midnight which ends the day. In such cases the figures are in heavy type, and it is to be remembered in using this table that these distinctive figures always indicate a time on the morrow of the day of its line. A similar system is followed in the Tables of the planets. (See pages 5, 9, 13, &c.) In the ephemerides of the planets on page 3 of each mouth, italic figures are occasionally used (pages 8, 12, 16, 44) to indicate the change of sign of the declination noted in the heading

Double High-Water.—Among the Tidal-Constants on pages 52 and 53 it will be seen that for Southampton and some other places near the Isle of Wight two times of High Water are indicated, differing by two or three hours. This is the result of observation, but an explanation sometimes advanced that it is the effect of the combination of two tides, one of which passes round the Island, the other arriving normally, is believed to be erroneous. In shallow water the main tidal oscillation generates a secondary oscillation of small range and half the period of the main oscillation, and normally in an estuary this tends to accelerate high water and to retard low water. In the neighbourhood of the Isle of Wight the normal relationship of primary and secondary oscillation is disturbed and the four maxima of the secondary tide become prominent at Southampton, and the four minima at Portland, so that at the former place there are double high waters and at the latter there are double low waters.

* The days thus indicated throughout the Almanack are those on which High Tides may be expected. Strong northerly which in the North is a and a low barometer with heavy rams in the countres drained by the Thames may cause a higher race of the rive, and the low hing riversaled districts to be fielded.

MORNING AND EVENING STARS.

O MERCURY 11ses before the Sun in the first part of the month, but will not be seen.

? VENUS continues to be an evening star setting later might by might, and grows bughter. It will be a prominent object in the south-west sky in the early evening. Magnitude -35 to -36.

d Mars rises almost with the Sun throughout

the month and sets before, so that it will not be visible

2 JUPITER being in Opposition on the 7th, is above the horizon throughout the night. It will be due east at altitude 20° at about 6 o'clock in the evening in the middle of the month. Magnitude 21.

Is SATURN rises rather more than an hour before the Sun in the S E. by E — It is scarcely likely to be Magnitude +0 8. visible

Blassextile.—When Julius 'cosar reformed the Roman Calendar in the year 46 B.C., 365% days was adopted as the mean length of the year, that being the value then current in Egypt. Three out of four years were given 365 days, and the fourth, 366 days, the sixth day before the Kalends of March being repeated. The intercalary day came to be called ante diem bis sextum Kalendas Martias, or more briefly bissextum, whence our word bissextile for leap-year.

Before the introduction of this calendar the Roman year consisted of 335 days, with a month of 33 days intercalated after February 33 when necessary. This intercalation had, however, been sometimes omitted, and it was found necessary to make the year 46 B.C. consist of 445 days. This year is called the Year of Confusion

CONJUNCTIONS, ECLIPSES, AND OTHER CELESTIAL PHENOMENA.

April r. Day breaks at 3h. 38m.
Civil twilight ends 19h. 18m.
Night begins 20h. 32m. The
length of the Day is 12h. 53m.

Apr. 4, 22h. Mars in conjunction with D. & 2° S.

Apr. 6, 15h. Mercury in conjunction with D & 0.7° N.

Apr. 9. Jupiter at a stationary Point.

Apr. 9. Uranus in conjunction.

Apr. 10. Mercury at Inferior conjunction.

Apr. 10, 6h Venus in conjunction with D. 9 2 8.

Apr. 15, 12h. Jupiter in conjunction with D. 43° S.

Apr. 19. Venus at Greatest Elongation. 46° E.

Apr 21, 8h Mercury in conjunction with Mars \$ 0.3° N.

Apr. 27, 9h Saturn in conjunction with \$ 1,4° N.

In this month the Mornings increase 62m.; the Afternoons 48m.

Constellations near the South meridian at 22h.: Cancer, Hydra, Leo, Leo Minor, Crater, Corvus, Virgo

April 15. Uranus rises 5h. 1m., sets 18h. 19m. Neptune rises 14h. 0m., sets 3h. 50m.

The Planet Venus.—Venus is now very prominent in the evening sky, and at the end of April does not set until xo minutes before midnight. This is periodic, and occurs every eighth year, i.e. in alternate leap-years. The planet describes her orbit round the Sun in 2247 days, and 23 of these periods are very nearly the equivalent of 8 solar years. It is also the case that the synodic period of Venus, which is the interval between successive conjunctions with the Sun, superior or inferior, or the interval in which the faster moving interior planet gains a lap on the Earth, is 324 days, and five of these are equal to 8 solar years. Consequently, at intervals of that number of years, greatest eastern elongation occurs at the same time of year, and at spring elongations. Venus is at a part of her orbit which is then seen high above the Equator, and these

MORNING AND EVENING STARS.

- § Mercury in the early days of the month will be above the horizon for an hour after sunset. It will be a morning star after the roth, but in neither case is it likely to be seen.
- Q VENUS will not set until 10 minutes before indnight at the end of the month I throves through the constellation Taurus and adds to the brilliance of the western evening sky. Magnitude -3°8 to -4 x.
- δ MARS is still not visible, for it rises only a few minutes before the Sun and sets much earlier.
- If JUPITER is due south in the early evening. It reverses its direction of motion and moves slowly in the constellation Cancer towards Leo after the 9th. Magnitude -19 to -17.
- 1. SATURN in Capricornus uses less than a hours after midnight at the end of the month, and may be seen at a low altitude in the east-south-east in the early dawn. Magnitude +0.9.

1	8.	ATURN	1 ₂	
D. 3 10 17		Souths 11. m. 7 37 7 11 6 45 6 10		

are the reasons for the circumstances mentioned. The high altitude in early evening may be explained otherwise by saying that at this time of year in this latitude the ecliptic is inclined to the horizon at a large angle at sunset; Venus, like all the planets, is somewhat near the ecliptic, and her distance from the Sun, which is on the horizon, measured on the ecliptic is also large, since she is at or near maximum clongation. Circumstances are somewhat similar,

The planet will be at greatest western elongation on September 8 of this year, when it will rise shortly after z o'clock, the hour being thus early for reasons that are akin to those given above.

Jupiter without Satellites.—It is shown in these pages (see pp. 3z, 36 and 58) that each of Jupiter's larger Satellites is eclipsed, occulted by, or is in transit across the planet's disc at regular intervals. These events are sometimes contemporaneous, and Jupiter is therefore seen occasionally as though it had only three, two or even one Satellite, and on rare occasional as the seen occasionally as though it had only three, two or even one Satellite, and on rare occasional four may be indiden in this way simultaneously and Jupiter is said to be without Satellites. The length of the intervals between such occurrences follows no law. In the see years 1800 to acco there have been or will be, 36, and it chances that three of them happen in the space of the two years current. Juniter's four large Satellites were simultaneously invisible, exterior to the planet, for \$\frac{1}{2}\$ hours in the evening of 1931, Feb. 14. This will happen from \$\frac{1}{2}\$h. \$\frac{1}{2}\$m, to \$\frac{1}{2}\$h. \$\frac{1}{2}\$m, to \$\frac{1}{2}\$h. \$\frac{1}{2}\$m. in the morning of November \$\frac{1}{2}\$ of November \$\frac{1}{2}\$ of

MORNING AND EVENING STARS.

Mercury is a morning star, but rises too near to the time of sunrise to be seen.

Q VENUS is still above the horizon until nearly midnight, and will be due west at altitude 30° about 8 o'clock. It moves into the constellation Germin and will be in the neighbourhood of the Twins at the end of the month. Magnitude -4's (Greatest Brilliancy).

J MARS begins to be a morning star since it rises an hour before the Sun at the end of the mouth; in the E.N E.

 $_{2}$ JUPITER is high in the south-west at sunset, and will be seen when the sky grows dark. It sets nearly in the west-north-west in the hour or two after midnight. Magnitude $-\mathbf{r}$; to $-\mathbf{r}$ 5.

12 SATURN is now more prominent as a morning star since it rises before midnight at the end of the month. Magnitude +08 to +06.

this year. At the time Jupiter is without Satellites on May 4 the planet will be below the horizon at Greenwich, but the phenomenon may be observed from America and places not so far west. On the second occasion the planet will be about 13° above the horizon at Greenwich, at sh. 12m. when Satellite IV will be eclipsed, and at that time II will be in transit, and III and I undergoing occultation, reappearing at sh. 2sm. and 3h. 46m. respectively. Satellite II will complete its transit at 3h. 33m.

CONJUNCTIONS, ECLIPSES, AND OTHER CELESTIAL PHENOMENA.

June z. Civil twilight ends at znh. 2m. There is no closed night in this month in the latitude of London. The length of the Day from Sunrise to Sunset on June z is 16h. 14m. Its length is nearly 16h. 34m. from the 19th to the 24th.

June z, 4h. Mars in conjunction with D. 35 S.

June 3, 12h. Mercury in conjunction with D \$\Quad 60 S.

June 6, 22h Venus in conjunction with D. 2 3°S.

June 7. Venus at a stationary point.

June 9, vol. Jupiter in conjunction with D. 4 2° 8

June 13. Mercury in Superior conjunction.

June ax, xh Saturn in conjunction with D. h 3° N

June 21, 15h. Sun enters the sign Cancer (Solstice).

June 29. Venus in Inferior con-

In this month the Mornings increase about 7m up to the 1xth and then decrease 4m. The Afternoons increase about 1x4m. up to the 1xth, and then decrease shoutly.

Constellations near the S. meridian at midnight Corona, Hercules, Ophinchus, Scrpens, Scorpus, Lyra, Aquila, Sagittarius.

APPARENT RIGHT ASCENSION AND DECLINATION OF THE PLANETS AT NOON.

Photo-Electric Photometry.—Electrical properties that are developed in certain substances under the influence of light have led to methods of measuring luminosity and its variation and have been adapted for several practical uses. The element selenium may be said to be a non-conductor of electricity when in the dark but becomes a conductor along which a current variance when light falls on it, the strength of the current varying with the intensity of the light. It has also been found that some metallic substances, seven of which are known, potassium being one, shed electrous under the influence of light, and hence become electrically charged, leading to the production of current, the rate of charge being proportional to the light intensity. Devices embodying these principles known as selenium and photo-electric cells are in use for astronomical photometry. Placed in the focus of a telescope objective the light of a star falling on the receiver of a cell of either kind causes a current to flew or a charge to accumulate that can be

MORNING AND EVENING STARS.

- MERCURY is a morning star at the beginning of the month but will not be seen It will be an evening star after the 13th, but its visibility is again barely possible.
- Q VENUS remains a brilliant object to be seen north of west after sunset in the early days of the month, but becomes fainter rapidly, and sets in the early twilight, in the latter part
- of MARS rises a hours, more or less, after midget in the brightening sky in the N E by E.
- 14 JUPITER now not very far to the west of Regulus is to be seen almost due west in the early evening; but the time for its visibility is short for it sets before midnight. Magnitude -1'5 to -1'4.
- SATURN is in the south-east, approximately, at midnight, at altitude to to 15 degrees. Magnitude +06 to +08.

registered, and the implining light measured with remarkable accuracy With the photo-electric cell differences of density of deposit on a photographic negative, which is an essential of many astrophysical researches, can be determined with similar precision. Photo-electric cells have other can be determined with similar precision. Photo-electric cells have other uses besides those of astronomy. They are essentials in the processes of television or picture telegraphy; of talking cinema pictures and in the construction of burglar alarms that depend on the interruption of the implinging ray. A proposal to use the light of Arcturus to start machinery at the starlight may be in the first place feeble, but it may be amplified sufficiently to actuate a relay that would bring stronger currents into action.

that would bring stronger currents into action.

Thermometry,—Temperature and its changes are commonly measured by a thermometer of which the expansion of mercury is the basic principle, but there are electrical thermometers whose action depends on a certain electrical property of metals that is developed under the influence of heat.

influence of heat.

The thermo couple, or thermopile, depends on the fact that a thermo-electric force is produced when a circuit, in which a galvanometer may be included, is formed of two metals, necessarily with two junctions, and one of the junctions of the two metals is at a higher temperature than the other. If, for example, in a circuit of copper wire with a length of iron inserted, one of the junctions is made hotter than the other, the galvanometer will show a current passing in the direction from copper to iron at the hotter junction, the statement being subject to some qualification. A sensitive instrument of this kind is used in astronomy, and with a vacuum thermo-couple made of bismuth and bismuth-tin placed in the focus of the rec-inch

MORNING AND EVENING STARS.

- \mathfrak{T} Mercury will be at Greatest Elongation (E) on July 20, and is an evening star throughout the month, but sets not much more than an hour after the Sun at most, and is hardly likely to be seen.
- ♀ VENUS having been in Inferior conjunction on June 29, is not to be seen early in the month, but may be visible before sunrise in the latter half S E by E. Magnitude on July 31, -4 2.
- 3 MARS, moving eastward, passes about 5 degrees north of Aldebaran on July 6. It will be in the E.N.E. in the morning sky. Magnitude +2 c.
- $\frac{1}{2}$ JUPITER will be above the horizon for a short time after subset and may be seen north of west. Magnitude $-x^2$ 3.
- is SATURN being in Opposition on the 24th is above the horizon throughout the short night. Magnitude +0.3.

telescope at Mount Wilson, the heating effect of a star as faint as the thirticenth magnitude can be measured. There is also an Electrical Resistance Thermometer which is effective because the resistance of a pure metal, platinum, for example, to the passage of an electric current increases considerably when its temperature is raised. The surface temperature of celestial bodies is estimated from the position in their spectrum of the lines of greatest intensity or energy. Just as the colour of a heated iron changes with increase of heat, so the distribution of energy, which is analogous to colour, shown by the intensity of the lines in stellar spectra, varies with the temperature.

An Earthquake in England. In the early morning of June 7, 1921, an earthquake of some severity was experienced in England. No serious damage was done but the occurrence, made evident by shaking beds and swinging pictures, was sufficient to cause alarm to some, though by the great majority of the population it passed unnoticed. The shocks were felt in all parts of England from Bournemouth to Aluwick, from Cardiff to Hull where the effects seem to have been most severe, and, it is said, as far west as Waterford. The fall of a chimney stack was reported from the neighbourhood of Hull as an effect of the earthquake. Besides these visible effects the earthquake was rescaled by the sekanegarable at Kew. Oxford. West Bromwich, Liverscott carthquake was recorded by the seismographs at Kew, Oxford, West Bromwich, Liverpool,

MORNING AND EVENING STARS.

MERCURY, being at Greatest Elongation, West, on Sept. 3, may be visible in the morning in the last few days of the month after 4 o'clock, a few degrees above the horizon, E. by N.

Q VENUS rises unusually early, and is at greatest brilliancy on August 5, so that the planet makes a fine display as a morning star this month. It moves eastward through the constellation Gemini. Magnitude -4°2 to -4°2.

d MARS moves into the constellation Gemini. will be in the neighbourhood of, but 5 degrees nigher than, Venus throughout the month. It is much less conspicuous than that planet, being about as bright as Castor.

I JUPITER, being in conjunction on the a6th, rises and sets nearly with the Sun during this month.

h SATURN is now to be considered an evening star. It will be seen between S.E. and S. at altitude about to degrees when the sky becomes dark.

SATURN L

Stonyhurst, Edinburgh, Aberdeen and Durham, and by many on the Continent. From these records it was deduced that the epicentre, or place of origin on the earth's surface (see p. 76) was in the North Sea, so or 60 miles east of Hull, and that the earthyuake happened as minutes

or on miss east of mun, and that the earthquake happened as minutes and some seconds after midnight of June 6.

Notable earthquakes that have occurred in England in comparatively recent years are those in the neighbourhood of Colchester on April 28, 1284, and in Western England on December 17, 1896, and August 25, 1926, the epicentre in both cases being found to be a few miles from Herenord. This district has been the scene of earthquakes on other dates.

The Moon's Surface,—With a small telescope there will be seen on the Moon features that have been called seas (perhaps rather unfortunately), mountain ranges, craters, rays and rills. Bright rays and rills are seen best at Full Moon, the other classes at times near the quarter phases, and especially when near the line of demarcation between the illuminated and dark parts of the lunar surface. The most remarkable are the craters, or nearly circular formations, having for their circumference a ling of mountains which rise abruptly to heights anything between 1,000 and 20,000 feet above the surrounding country. The number and size of these—many of them being 50 or 60 miles in diameter—make the Moon's surface quite unlike that of the Earth. It has long been suggested that these are the result of volcanic action on the Moon, but if this is so, they must be fossil formations. There is no trace of anything on the Moon that in the least resembles an expanse of water, which would be seen giftering in the sunlight, nor are any striking changes that might be atmospheric seen as on the planets. We appear, in fact, to be looking on a dead world.

MORNING AND EVENING STARS

o MERCURY is a morning star and may be seen between 4 and 5 o'clock in the early days of September north of the east point.

Q VENUS continues to be a brilliant object of the morning sky, rising before a o'clock. It will be due

morining sky, raing orders of order. It will be the east at an altitude of so degrees about 4 o'clock. Magnitude — 40 to — 38

3 MARS uses shortly after midnight. Venus is moving towards Jupiter, and at the end of the month, in the dawn, the three planets will be in a line stretching upwards over the eastern horizon, with Regulus between Venus and Jupiter. The waning Moon passes along the line between the asth and a8th. Magnitude + r'8.

4 JUPITER IS a morning star in the following part of b. Magnitude - 1'3.

h SATURN, low in the south in the early evening, Leo.

The Harvest Moon.—The Full Moon on September 24 is the Harvest Moon this year, and it will be seen that the times of moonrise on Moon this year, and it will be seen that the times of moonrise on September 13, 14, 15 and 16 show differences between consecutive nights of only so minutes. This daily retardation is unusually small, as it was at Harvest Moon lest year, and at other phases in recent months, which is due to the fact that the longitude of the Ascending node of the Moon's cribit is not far from 360°. In northern latitudes, at the time of moonrise on the days about Full in September, the Moon's orbit is inclined to the horizon, but at a small angle, and the smallness is accentuated when the node is in this position. The Nodes of the Moon's orbit regress on

Conjunction of Venus and Jupiter.—These bright planets make a special display in the morning sky this month. Since July, Venus has been moving through the constellations Gemini, Cancer and Leo towards Jupiter, which is moving less rapidly in the same direction, and overtakes it in the morning of October so. The planets will rise separated by less than 7 minutes of arc, or by rather less than a quarter of the diameter of the Moon, this distance increasing slightly before surrise. Conjunctions of Venus and Jupiter occur almost yearly, though they may not happen when the planets are in the night sky as is the case this year. The last was on August 6, 2831, the next will be on August 17, 1933. The distance between the objects is comparatively small on this occasion, but at a conjunction on February 6, 1892, that was seen from Australia,

MORNING AND EVENING STARS.

- MERCURY will not be seen either in the morning or evening this month It sets only half an hour after the Sun at its end.
- Q VENUS continues its eastward progress and moves into Leo, being near Regulus in the morning of the 6th. Its approach to Jupiter, and close conjunction with that planet on the soft (see p. 40) will be noted. Magnitude -3.8 to -3.6.
- of MARS rises shortly before midnight during the greater part of the month, and will be seen in the morning sky on the right of Regulus, to which it is equal in brightness. Magnitude +x 3
- JUPITER will be seen between east and southeast in the morning sky. Magnitude -1'3 to -14
- b SATURN may be seen low in the south-west in the early evening. Magnitude +o7 to +o8.

	SATURN b

their edges were separated by 14 seconds of arc only, and the planets were seen as one until this had increased to about a minute and a half.

The Temperature of the Sun,—The effective temperature of the Sun, or the rate at which heat is emitted per unit area at its surface, is in the neighbourhood of 5,500° C. This is calculated from the Solar Constant, which is a measure of the heat received from the Sun outside the earth's atmosphere found from observation The Sun's temperature is also evaluated by the method mentioned on p. 29. The results are in approximate but not precise agreement.

The Leonid Meteors.—On the night of November 13 1833, and again on the same date in the year 1866, showers of meteors were seen radiating from a point in the "Sickle" of Leo in sumbers that were described as "terrifying" Moderately fine showers were seen from the same radiant in 1833 and 1859. After the display in 1833 it was remembered that a similar shower had appeared in 1859 and examination of historical records resulted in finding many instances of notable meteor showers seen in November separated by intervals of multiples of 33 or 34 years. A few shooting-stars are seen from the same radiant about this date in every year, and the inference is that there is a stream of small bodies moving in parallel paths in a long, oval orbit roud the Sin that intersects the orbit of the Earth at the point where the Earth is in November. In the greater part of

ov 15. Uranus rises 14h. 57m., sets 4h. 16m Neptune rises ok. 24m., sets 13h. 57m.

MORNING AND EVENING STARS.

- MERCURY though at greatest elongation, east, on the 14th sets less than an hour after the Sun throughout the month and will not be visible.
- ♀ VENUS is a morning star rising at the times shown. It will be in the south-east about half-past 6 o'clock. Magnitude 3'5.
- of MARS is a morning star It will be a degree and a half north of Regulus in the morning of the roth. Magnitude $+ x \cdot x \cdot t + o \cdot g$.
- ?! JUPITER IS still in company with Mars and Venus, but their relative positions have much changed. At 5 o'clock towards the end of the month Jupiter is fairly high in the south-east, with Mars 10 degrees higher on its right and Venus considerably lower on its left. Magnitude 1'4 to 1'5.
- b SATURN sets in mid-evening nearly at the southwest point. Magnitude + o 8.

this orbit tile lookes are few, but in one part they are many and stand out like the jewel in a ring, this profuse mass going round the orbit in 32½ years. A meteoric shower occurs when such an orbit intersects the earth's orbit and the stream and the earth arrive together at the point of intersection, and because a display was seen in consecutive years, 1866 and 1867, it seems that the jewel must be of some length. It was reasonably expected that the Leonid meteors would be seen in some profusion in the years 1800 and 1900, but they failed to appear. Nevertheless, it as thought possible that they may visit us in some number in November of one or more of the years 1932 to 1932. The presence of the almost full Moon in the sky is likely to prevent any spectacle this year.

The Earth's Rotation.—Ephemerides are computed on the assumption that time moves The Earth's Rotation.—Ephemerides are computed on the assumption that time moves uniformly, and that the length of a day, whether mean solar or uniform sidereal, is invariable, except for a small recognised secular variation. It is now believed that the rotation of the Earth, upon which the length of the day depends, is not constant. Such a change, although imperceptible from day to day, would lead to a cumulative error in time reckoning, so that the observed time as shown by the clock might differ by many seconds from the time which the compilers of the tables of the Sun, Moon and planets expected the clock to show at a given moment of absolute time, the effect of this error being revealed not as an apparent clock error, but as an apparent error in the ephemerides of the Sun, Moon and planets. It was the correlation of these apparent error that led to the announcement of the variability of the Earth's period of rotation, (From the Nantical Almanas case. Explantion.) Nautical Almanac 1932. Explanation.)

Dec. 15. Sun's semidiam in Transit, 1m. 10'018. of Mean Time.

MERCURY rises nearly two hours before the Sun in the last ten days of the month, and may then be seen at 7 o'clock about 5 degrees above the southeast horizon.

Q VENUS will be seen in the south-east before sunrise. Altitude 15° at about half-past av at the beginning of the mouth, but lower at that hour at the end. Magnitude -34.

Mass moving in the constellation Leo approaches Jupiter but does not overtake it. Its

brightness increases rapidly. Magnitude +o'9 to +0'3.

JUPITER like Mars rises before midnight, and both are conspicuous objects of the morning sky, mov-

ing eastward between Regalus and Spica. Magnitude -r'6 to -r'7.

12 SATURN is above the south-west horizon for a

short time after sunset. Magnitude +o o.

Large Telescopes.—The Royal Observatory, Edinburgh, possesses a reflecting telescope with mirror 36 inches in diameter that was installed in the year 1930, and there is also a 3-foot reflector at Cambridge. A similar instrument with mirror of the same dimension, the gift of Mr.

similar instrument with inirror of the same dimension, the girt of Mr. W. J. Yapp, is being made for the Royal Observatory, Greenwich. These will be the largest objectives in use in Great Britain. There are some larger on the Continent and in America, the largest of them now being the zeo-inch mirror at the Mount Wilson Observatory, California, but a zeo-inch mirror is being made for use in that part of the world. A reflecting telescope, 74 inches in diameter, is part of the equipment of an observatory now being established by private munificence near Toronto.

THE TIME OF HIGH WATER at the undermentioned Ports and Places may be approximately found by taking the appropriate Time of High Water at the Standard Port (as shown on pp. 5, 9, etc) and adding thereto the quantities annexed. The time thus found will be Greenwich Time for British, Irish, French and Belgian Ports, and Amsterdam Time for Netherlands Ports. The rise of the tide at Springs and Neaps is given in the last two columns. An* denotes Range of Tide.

54 Tables for Finding the Times of Sunrise and Sunset.

THIS double entry table provides the means for finding, with sufficient accuracy for practical purposes, the times of sunrise and sunset at any place situated between latitude 60° N. and 60° S.

To use the table: In the horizontal line with the Sun's declination in the first column, and under the required latitude in the heading, there will be found figures which added to rsh. give the local apparent time of sunset. Subtracting these quantities from rsh. will give the local apparent time of surise. To obtain from this the local mean time, the equation of time for the day in question which is given on the second page of each month, must be added to or subtracted from these apparent times of sunuse and sunset, as shown in the heading.

To find the corresponding Greenwich mean time, the difference of longitude of the place from Greenwich must be added if the place be West, subtracted if East The table is arranged for northern latitudes, but will serve equally well for places south of the Equator, if the declination North in the first column be considered South and rice were

column be considered South, and vice verse.

If the figures are required for a declination or latitude failing between two arguments of the table, they may be found by proportion. The effect of refraction is included.

THE TIME OF SUNSEL.

The times of sunmise and sunset given in this Almanack (and similarly of moonrise and moonset) are the times when the centre of the Sun's disc is seen on the horizon from sea-level at Greenwich, computed on the assumption that the horizontal refraction is 24½. It is doubtful whether there is a precise legal definition of surse and sunset. The above has generally been adopted as a correct statement, though in some Tables the instant when the upper limb, or edge,

EATITUDE.	
	66°
h m h m h m h m h m h m h m h m h m h m	66° h m. 111 131 151 151 151 151 151 151 151 151

of the Sun is on the visible horizon is given as the time when the Sun rises and sets. The legal question has been more concerned with the distinction between local sunset and tree when the sun sets at the place in question. Greenwich sunset, rather than with a precise whether it be stated in local or Greenwich time.

TO WIND THE GREENWICH TIME OF SUNRISE AT CERTAIN PLACES IN THE BRITISH ISLES IN EACH MONTH OF THE YEAR.

The Table gives the number of minutes to be added to or subtracted from the time of sunfise at Greenwich, to find the Greenwich time of sunrise at the place named in the first column, on the first day of each month. The corrections to be applied on other dates and for other places in the neighbourhood of these may be inferred approximately by interpolation.

The sign + means that the time required is later than that at Greenwich. The sign -, has

it is earlier.

If these Tables be considered in conjunction with a map it will be seen that the places at which the Sun rises at the same moment lie in a slightly curved line across the map, the lines for different moments being approximately perallel. The lines change their inclination to the meridian throughout the year. Similarly for the setting.

The times in the headline and penultimate column are Apparent. By applying the Equation

The times in the headline and penultimate column are Apparent. By applying the Equation of Time, the Mean Time is found to which the figures are appropriate.

Alt.—This is given to tenths of a degree, but there may be small differences between the morning and afternoon hours, and between the like days of the year. The effect of Refraction is not applied. Azimuth (Az.) is measured either eastward or westward from the N. Az. 45° is equivalent to N.E. or N.W. Az. 135° to S.E. or S.W. E.S.E. or W.S.W. is 122½°.

The year is divided into periods of thirty days (with exceptions). The figures for days other than those given can be found by interpolation with approximate accuracy.

Latitude 33° is chosen as an average for England. North or south of this the moon altitude is respectively less or greater by the difference of latitude, and for other times pro rata.

Lolar and Lidereal Time.

TO FORM EQUIVALENT INTERVALS OF SOLAR AND SIDEREAL TIME.

THE length of a Sidereal day is 33t. 56m. 4 29s. of Mean Time One hour of Sidereal Time is, therefore, equivalent to 59m. 50 17s. of Mean Time, and one hour of mean solar time is equivalent to 18. om. 9 86s. of Sidereal Time. The multiples and submultiples of the differences from one hour are tabulated below under headings "acceleration" and "retardation"—for the argument (common to both) in the middle columns. If the argument be considered as Mean Time, its equivalent in Sidereal Time is obtained by adding the acceleration. If it is Sidereal Time, its equivalent in Mean Time is found by subtracting the retardation

Celestial Phenomena for Observation in 1932.

ECLIPSES OF THE SUN AND MOON.

In the year 1932 there will be two Eclipses of the Sun and two of the Moon. One of the Solar eclipses is Annular, and visible only from a region near the South Pole. Both the Lunar

region near the south rote. Lead the second see partial but very nearly total.

I. An Annular Eclipse of the Sun on March 7, invisible at Greenwich. The path from which annularity may be seen is a short, wide are in the Southern Ocean, south-west of New Zealand, its middle point being about Lat. 62° 5', Long. 235° E. where the phase will last for 5 minutes 29 seconds. A partial eclipse will be seen about

sunset in Australia.

II. A Partial Ectipse of the Moon on March 2s, invisible at Greenwich. The beginning will be visible generally from Eastern Asia, Australia, the Pacific Ocean, North America, except the north-eastern part, and from the extreme western part of South America; the ending will be visible from Asia, except the south-western part, the Pacific Ocean, and from the extreme north-western part of North America.

The above is a list of stars, chosen within certain limits as to magnitude and phase of the Moon, that will be occulted during the year, with the time of the phase of the occultation mentioned as seen from Greenwich. In general the phase is that which takes place at the dark limb, but the disappearance of Regulus on Nov. 21 and of ρ Leonis on Dec. 29 are both at the bright limb. The Moon is among the Pleiades on the night of January 28, in the early morning of Aug. 24 and on the night of Nov. 13. On the last occasion both phases of the occultations take place at a sensibly bright edge since the Moon is Full in the morning β the day mentioned. The "angle from N. point" shows the place of disappearance or reappearance on the Moon's edge, and is measured from the point nearest the Pole of the heavens (not the highest point) towards the east

JUPITER'S SATELLITE PHENOMENA.—The Table on p. 28 gives the Times of Disappearance (D.) and of Reappearance (R.) of the Satellites of Jupiter at Eclipse that will happen when Jupiter is above the horizon at Greenwich and the Sun below. These phenomens are seen simultaneously from all places where the planet is above the horizon at the time. From opposition to conjunction, i.e. from Feb. 7 to Aug. 26, the eclipses take place on the eastern side of the planet; from conjunction to opposition on the western. In the latter periods, i.e. from Jan. 1 to Feb. 7 and from August to December, satellites I and II disappear by eclipse and reappear from occultation at the eastern edge. The times of such reappearances (Uc. R.) are given, the satellite and the time of its disappearance being in the preceding line. From Feb. 7 to Aug. the converse happens, and the times of disappearance by occultation (Oc. D.), and of reappearance after eclipse are given, the satellite being named in the second line. Near the time of opposition this pertains to satellites III and IV as well as to I and II as will be seen by examples on Jan. 31 and Feb. 26. The eclipse of a satellite is always accompanied by its occultation which precedes the eclipse from opposition to conjunction of Jupiter, but follows it from conjunction to opposition. In the morning of Jan. 3 satellite IV will disappear by occultation at 2h. 24m. and on the night of March 21, III will be occulted at 23t. 25m, reappearing at 3t. 15m. On the evening of April 129 when II and III are simultaneously eclipsed, I will be in transit across the dir-2 from 2sh. 15m. to ch. 33m., so that for a period Jupiter will be seen with only one exterior satellite, whilst a the morning of Nov. 21 there will be none from 2.25 (see p. 21)

AT star is defined by the Right Ascension and Declination, which are co-ordinates analogous to longtuide and latitude on the terrestrial sphere. The lines of reference to the colestial

sphere depend on the position of the axis of the Earth since, for reasons known generally by the word Precession, this position has a continual small movement with respect to the stars, Right Ascension and Declinat on change by an annually amount that can be computed by formula. Observation of the

mila. Observation of position of the stars shows that they do not conform precisely to this computed precessional change, and the outstanding amount for individual stars Motion (mee page 5), is shown in two columns of the adjoining table. The annual precession and Proper ecession and Proper

Motion combined, or the amount by which each element of a star's position changes in a year, taxown as the Variation is also shown The angular parallax of a star is the angle that the mean radus of the Earth's orbit would placed

mean radus of the Earth's orbit would, placed aquarely, subtend at the star, and is therefore inversely proportional to its distance, and hence is a measure of that same. The marallaxes in the adjoining table are

mainly trigonometric (see p. 64) and are taken from the General Cataiogue of Parallaxes collected by Dr. Frank Schlesinger of Yale. The entry coe indicates that the star is

WHITAKER'S ALMANACK. 1982.

THE objects of the sky, Sun, Moon, Planets, Stars, appear to us to be fixed on the interior surface of a hemisphere of which the observer is the centre. Actually the various classes of objects are at very different distances. The Moon, our nearest neighbour, is 20,000 miles from us; a distance which light, travelling at the rate of 25,000 miles a second, traverses in less than a second and a half. Of the bodies of the Universe whose distance is known, the farthest is so remote that its light takes over to cac, oco years to reach us. The nearest star to the Sun is more than eight thousand times as far from it as is the planet Neptune. It is the purpose of modern astronomy to investigate the method of distribution of these bodies in space, their movements and their sizes. Cosmical Physics attempts to deduce their physical nature, and that of cosmical matter in general from the observations of the astronomer, combined with knowledge gained in the laboratory, with the hope of finally elucidating their past and future history. The total number of stars of magnitude 6 and brighter, which is sometimes taken as the limit of naked-eye visibility, is about 4,300, of which 3,000 are visible during the year from latitude 60°, but a more generous estimate, formed by including cases when two faint stars close together are seen as one, sets the whole number at re, oce. By the aid of the photographic plate objects are detected and recorded which no eye can see, even with the best optical aid, and from counts on such plates estimates have been made of the number of stars in the Universe. s.coc.coc.coc was once assigned as a limit to their number, but this has been much increased by various estimates. From them 50,000 millions may be taken as the possible total number of stars in the galactic system (n. infra), though twice that number has been mentioned as a reasoned estimate. The number in the whole of space is incalculable.

THE STRUCTURE OF THE UNIVERSE.

The stars are divided into groups according to their apparent brightness and down to the 9th or roth magnitude the number of each magnitude is known, all to this order having been catalogued. For fainter stars the numbers have been derived from counts in sample areas. If the Universe is an aggregation of stars in which the individuals of each degree of intrinsic brightness are distributed uniformly throughout an endless space, it can be shown that the number of stars brighter than the 4th magnitude would be about four times as great as the number brighter than the 3rd; the number brighter than the 3rd; the number of those brighter than the 4th in the same ratio, and so on indefinitely. When the numbers of stars of different magnitudes obtained by counts are compared it is found that this star-ratio, as it is called, in the case of the brighter stars, approaches but does not attain the theoretical value 3.95, and that the ratio decreases continually as the stars are fainter, until at the ration of this observed fact is that the universe of stars accessible to vision is limited; either there are few or no stars beyond a somewhat indefinite boundary, or we are prevented from seeing them by absorbing material distributed throughout interstellar space.

Interstellar space.

It is established from counts and measured distances that around our Sun the stars are fairly uniformly distributed at the rate of about one

per ze cubic parsecs. It is obvious that a uniform distribution of this nature cannot go on indefinitely, for, if it did, the background of the firmament would be bright, since in whatever direction we looked we should, in time, come to

a star.

To a casual glance it is clear that the stars are not uniformly distributed over the sky, but have a tendency to congregate near the great beit of cloud-like forms which encircle the heavens, known as the Milky Way or Galaxy. Applying the method of sounding by "star ratios" above outlined, it is found that the stars appear to thin out less rapidly as we go out in the plane of the Milky Way than they do in the direction of the galactic poles. The deduction is apparent; the boundaries of the stellar system are more distant in the plane of the Galaxy than they are at the poles. In other words, the stellar system is an extremely flattened organisation, whose general form is, roughly, that of a double convex lens or of a watch. Looking along the galactic plane we find the stars crowding together, swe should expect, since this is the direction of greatest extension, and the Milky Way is therefore largely a depth effect. But examination of its prominent features, the great star-clouds, the irregularities in its form, and the deep rifts in its structure, shows that its appearance is not wholly due to depth, and that the region is the home of bodies and masses other than uniformly distributed stars. This aggregation is known as the Galactic System; it has been called the Stellar Universe, or the Universe, but the name is scarcely well-chosen because, as will be seen below, there are other aggregations which make this system merely a unit in an immense number of such denizes of space.

Statistical study of the distribution of the brighter stars shows that they form a local system that appears to have the same stape in general as the larger system spoken of, but the fundamental planes are slightly inclined one to the other. It was formerly a general belief that the Milky Waysurrounded this congregation of stars as a girdle, whether continuous withit or not was an open question, but a modern view supposes the existence of other local systems similar to this one of which our Sun is a member, all lying more or less in the Galactic plane that may be seen as star clouds in the Milky Way. The greatest condensation of stars as we see them occurs in the bright galactic clouds in Sagittarius, while the opposite portion of the Milky Way is a region of low concentration and brilliancy, from which it is inferred that we are not at the centre of the galactic system, but that this is about 50,000 light years from the Sun and is situated in a star cloud seen in Scorpius and Sagitarius (Shapley).

In 'and around the Milky Way there are irregular nebulae (see p. 6s) of which the nebula in Ornon is one of the most remarkable that are found to be comparatively near objects, and are to be considered as within the Galaxy. There are masses of dark nebulosity that appear as rifts obscuring the stars behind. But besides these there are nebulae of another type that are not seen about our central Galactic plane, though some, it has been suggested, may be hidden by the dark nebulosity, which are thought to be very distant from our Sun, but viewed with a powerful telescope are resolved into spots of light believed to be stars. Such nebulae were called by William Herschel "Island Universes."

The last columns show the light emitted compared with that by our Sun, considered to be of magnitude —s6 *g7 on the stellar scale. a¹ Centauri is the brighter of two bright stars seen as one by naked eye; they have a faint companion, Proxima. a¹, a², Crucis, if considered as one star (Mag r:s) would have been in the first of above lists. * Brighter component.

nebulae, and being, to some degree, of the same shape as, and bearing other resemblance to our own galactic system, are believed to be similar systems perhaps in course of making. About two millions of these extra-galactic nebulae are visible in the Mount Wilson xoo-inch telescope They appear to be scattered with a tolerable approach to uniformity through space, their average distance apart being something of the order of a,oco,oco light years. The most distant of them is about 140 million light-years from us.

To sum up modern ideas of the Cosmos we consider our Sun as one of millions, perhaps, that make up our local system. This, with other local systems and other bodies, make up the galactic system, which is merely one among millions of such systems that form the Universe.

Attempts have been made to estimate the imensions of this Universe of stars. Four dimensions of this Universe of stars. thousand light years was a former estimate of the diameter of our local system, but a more recent one is of the order of 20,000. recent one is of the order of 20,000. The larger diameter of the galaxy is estimated to be more than 200,000 light years; 140 million light years may be taken as the limit of the Universe, but this is considered by some to be much too large. STAR SPECTRA

Most of the bright stars and many of the fainter have been examined with a spectroscope, and have been divided into classes according to their type of spectrum as indicated by the lines which cross them, the spectral types being named by the letters O, B, A, F, G, K, M, N. The stars of the first two classes, O and B, have spectra characteristic of helium and hydrogen. Planetary nebulae, some stars known as Wolf-Rayet, in whose spectrum the chief lines are bright, and the bright stars of Orion generally are in this group. Stars whose spectra range between A and F—It is to be remarked that there is no rigorous line of division between the classes and that there are subclasses and spectra noted as

spectra broad absorption lines of hydrogen are conspicuous. In the next groups—F to G, and G to K—lines characteristic of metals appear. fine but numerous, and the stars of this class are yellow. The spectrum of our Sun falls late in the group F to G. The characteristic of the spectra of the remaining classes, M (and N), is the existence of a considerable number of flutings, and the stars are orange and red. tares, Betelgense, and a Herculis are notable stars in sub-classes of this type. (v. supra.)

STELLAR EVOLUTION.

The early stellar spectroscopists believed that they were investigating the chemistry of the stars and finding the material of which they are composed. It was thought that the hydrogen shown by the spectrum of Sirius would some day change into calcium, which is a leading characteristic of the solar spectrum, and hence that Sirius is in an earlier stage of development than the Sun. The modern view, based on labora-tory experiments, is that the spectrum shows tory experiments, is that the spectrum shows the radiative power or, in other words, the surface-temperature of the star, and that the hydrogen lines in the spectrum of Sirius, for instance, do not indicate an excess of that element, but, rather, that the star is at the temperature (10,000°C.) when those lines are prominent. The Sun is at a temperature of complete which is known from the fact that the the prominenc. The Sun is at a temperature of 6,000°C., which is known from the fact that ight of wave-length 4800 Angstroms is most abundant in its spectrum. This type of spectrum is charge teristic of from. Formerly the theory of stellar evolution was very simple. It was believed that cerisic of iron. Formerly the theory of stellar evolution was very simple. It was believed that stars began by being very hot and then cooled down, their spectrum changing in type until they arrived at a condition that gave a spectrum of type M and then disappeared. But about the year 1973 a hypothesis was propounded to the effect that in the beginning all stars are of Class M. That they are than bodies of eas of attraordination is no rigorous line of division between the classes they are then bodies of gas of extraordinarily and that there are subclasses and spectra noted as 'peculiar'—are white or bine stars, and in their brightness, which contract, grow continually

hotter, and pass through the successive spectral classes towards B, but only the more massive stars can generate enough heat to reach the white hot state required to produce spectra of that class; the others reach their critical density at spectral Class A, F, G, or even K. After this critical point in their contraction is reached the stars begin to fall off in temperature and in surface brightness and pass through the spectral classes in the reverse order until they have again become red stars of Class M. This is a deduction primarily from the fact that the red stars, or stars of type M, whose distance we know and whose actual total luminosity we can therefore deduce, divide into two classes: one of stars of great luminosity, the other of those of small. There are no known red stars intermediate in this respect. The same is true in less degree of stars of adjacent spectral type.

THE SIZE OF THE STARS.

The surface temperature of a star or rate of emission of energy per unit area is known, by help of a certain law, from the colour of the light that is emitted most profusely as shown by its spectrum, and since the intrinsic luminosity is the total outpouring of energy, it is easy to understand that the area of the surface may be deduced, and hence the diameter of the star. Writing generally, the size of the majority of the stars estimated in this way is of the same order as that of our Sun, though some may he so times as large, others smaller in the same ratio. The bright red stars, of which there are not many, are giants having diameters soo times or more that of our Sun. There are a few stars of peculiar quality known as White Dwarfs that are much smaller, but of an amazing density and weight.

The stars are too remote for even the largest to show an appreciable disc in any telescope as do the planets, and obviously the size of a star is not proportional to its brightness as we see it, for this depends on its distance, and also on temperature or other physical condition. It is possible, as suggested above, to deduce the diameter of a star from its spectrum and apparent brightness if its distance is known, but a more direct way of measuring stellar diameters has lately been found by an instrument known as an "interferometer," with which the angular diameters of several of the largest stars have been measured. Since the distances of these stars are known, the following values of the diameters in miles have been deduced, and it is satisfactory that these agree closely with the values derived from consideration of the surface brightness as above outlined:—

ABSOLUTE MAGNITUDE.

This phrase which is much in use in the astronomy of the present day, implies the luminosity of a star irrespective of its distance, to which reference has already been made. The precise from a simple observation.

definition of absolute magnitude is that it is the number that expresses, according to the usual system of stellar magnitude, the brightness of the star as it would be if it were at the distance of no parsecs (parallax \circ n'). It is clear that if the distance of a star is known, its absolute magnitude can be computed from its apparent, or by reversing the formula, if the absolute and the apparent magnitudes are known, the distance of the star can be determined, the numerical relation between M the absolute and m the apparent magnitude, being M=m+5+5 log π , where π is the decimal fraction indicating the parallax of the star.

DISTANCE OF THE STARS.

The distance of the stars from us is so immense that its determination is perhaps the most difficult problem of astronomy, and not until comparatively recent years has it been effected in any quantity and with much certainty. The direct method of determination of a star's parallax, as this quantity is called, consist in measuring the minute difference of direction of the star as seen from different points in the Earth's orbit. This is now usually done by photographing the star and its surroundings at appropriate epochs and measuring the change in relative position. A spectroscopic method of inding parallax through the absolute magnitude has been evolved. It has been found that in the spectra of stars the ratio of the intensity of certain pairs of lines is a function of the absolute magnitude of the star. In stars of great luminosity, for example, a certain Calcium line is very strong, whilst a line due to Iron is weak, but in a star which emits less total light the case is reversed. Examining and applying this principle to the spectra of stars whose distance has been found trigonometrically, a table correlating the above characteristic with the actual luminosity of a star may be inferred, and hence its distance.

The distances of some stars or groups of stars are found by indirect methods such as the following. If by any means it is possible to know the mean parallactic movement (see Stellar Motion) of a group of stars the mean parallac or distance of this group follows from a simple computation. In other words, the space through which our Sun travels, which is about twice the diameter of the Earth's orbit in a year, is taken as the base-line with which to measure the distance of the stars. The parallaxes of some binary stars have been found by a computational method assuming a value for their mass

(hypothetical parallax)

Kor some distant objects a method is adopted depending on a peculiar property of a class of stars known as "Cepheid Variables." These stars show very regular fluctuations, coming to maximum at intervals which range from a few hours to several days, and it has been found that the length of this period has a relation to the mean absolute brightness of the star. Those stars which have the longest period are the brightest, and a definite law has been evolved connecting the two elements. These Cepheid Variables are very common in globular starclusters—the peculiarity was, in fact, first suggested by a number seen in the lesser Magelland cloud—and by adopting this law it is clear that the great distances of such objects may be known

To express large distances a large unit is required. One of these is the space that light moves through in one year, which in miles is 6 followed by zz zeros; another unit is the parsec, or the distance at which the mean radius of the or the distance as which the hear radius of the Earth's orbit would subtend an angle of r" (parallax = one second). This is 3½ times the light year and is represented roughly by a followed by 13 zeros. The kiloparsec as equivalent for 2,000 13 zeros. The knopened as equivalent for the parsecs and the megaparse for a million are words now in use. There is also a unit little used called the Sriometer, which is equivalent to a million times the distance of the Earth from the Sun.

Within the sphere of to parsecs radius about the Sun as centre, there are rather more than a hundred stars whose distance has been measured. It is probable that more than that number remain to be discovered.

STELLAR MOTION

Many, if not all, of the so-called Fixed Stars are gradually changing their positions relative to one another, the movement of each star being called its Proper Motion. The seven bright stars of the Great Bear would on this account have formed in prehistoric times a configura-tion rather different from that seen to-day Consideration of these proper motions has led to the conclusion that they are in part due to actual movement in space of the stars themselves, but in part to the movement of our own Sun, which causes an apparent motion of the star in the opposite direction, this latter being called the star's parallactic motion I thus may, it has been found fairly conclusively that the Sun, and with it the Earth and planets. is moving through space with a speed of 19 5 kilometres per second towards a point on the celestial sphere not far from the bright star Vega speaking roughly, for there are differences in the determinations of the position of this

point. The Proper Motions of Stars of spectral type F and G are found to be much larger on the whole than those of other types, and it is therefore to be supposed that these classes are nearest to us. It has already been mentioned that our Sun is of this spectral type. By an optical principle known as Doppler's, it is possible to find from certain peculiarities of the lines in its spectrum the rate at which a star is approaching or receding from us. The "line of sight" or "radial" velocities of many stars have been found in this way, but the stars have been found in this way, but the possibility that such spectral peculiarities may be due to causes other than motion is to be remembered.

THE INTERIOR OF A STAR.

Astronomical physicists explore the interior of a star on the assumption that it is a volume of perfect gas whose molecules are in incessant motion, which constitutes its temperature, and whose pressure, density and temperature conwhose pressure, density and temperature con-form strictly to a certain relation (Boyle's Law), and on the further assumption that it has ad-justed itself to mechanical equilibrium such instead thesis to mechanical equinbrum such that the heat at any point within supplies just enough pressure to support the weight of the gas above it. They hence deduce the density and temperature at any point within a star, its mass and radiative quality or luminosity. It is believed that annihilation of its matter is the source of a star's energy, and that as a star grows older its mass lessens. A relation between has and luminosity found to hold in the case of certain stars for which these qualities are known is thought to hold generally, the more massive stars being the brighter, though a small class of stars of very high density known as "White Dwarfs," of which the best known is

the companion to Sirius do not conform.

An alternative hypothesis to that of the per-

STAR CLUSTERS AND NEBULÆ.

Among the apparently solitary stars there are found groups of stars gathered close together, some of which may be easily separable into individuals, others that can only be separated by the most powerful telescopes, and objects that appear as unresolvable patches of light; the latter are called nebulæ, and were aptly described by Sir William Herschel as "shining finid." A short list of the more interesting of these various objects is given herewith.

There are nebulæ called planetary that are small, regular in outline, and show a uniform disc. Analogous to these are some which are dark in the centre called annular or ring nebule. Beyond this the spectroscope divides the nebulæ into two great classes. The first spectroscopic observation of a nebula, made by Huggins in 1864, showed a spectrum of one bright line only, which indicated that these bodies, or at least some of them, are constituted of glowing gas. Later investigation showed that the spectra of some nebulae are continuous. The nebulae with continuous spectrum are called "white" uebulæ, in distinction to those with bright line spectra, which are "green" or gaseous. Photography has brought the means of studying the number and form of these objects in great detail and it is found that a large proportion of them are of spiral form They are the extra-galactic nebulæ already spoken of (see p 6a). The gaseous green nebulæ are in a small minority, and are generally diffused and irregular in outline and lie mostly in the Milky Way. The smaller, the so-called planetary and stellar nebulae, do not markedly avoid it as do the spirals which lie in a zone of the sky, roughly at right angles to the Galaxy. Globular star clusters also lie outside the Milky Way, but irregular clusters are within its limits. There Globular star are also masses of Dark nebular in space which may be the earliest form of matter. it is not possible to measure their distances directly, several lines of argument lead to the conclusion that the spiral nebulic are very far away. The nebulic have been much studied away. The nebulæ have been much studied recently as to their form and total brightness, and a system of classification has been proposed. The hypothesis is put forward that nebulæ of the same class are approximately of the same size, and hence that their relative distances may be inferred. Distance of the order of 250,000 parsecs has been assigned to M 31 and M 33 (see Table) from observation of the Cepheid variables they comprise (see p 65), and from this their actual size has been deduced. The dismeter of M ax (the Andromeda) is about 13,000 parsecs.

VARIABLE STARS.

Although the stars generally shine with unchanging brightness, there are some among them which are exceptions to this rule, and of these Algol, the star \$\hat{e}\$ of the constellation Perseus, is the best known In general this star is of about the second magnitude, but at regular intervals of something less than \$\hat{e}\$ hours it fades away to between third and fourth magnitude, remains so for about as minutes, and then regains its light. It is considered certain that this is due to partial eclipse by a dark companion that moves in an orbit round the bright star. The whole eclipse occupies about \$\hat{e}_2\fotar hours. The approximate times when this star will be at minimum in the months when it is suitably placed for observation are given in the table on page \$\hat{e}_7\$. The position of Algol is given by R.A. \$\hat{e}_4\$. M., Declination \$40^6 42^7 N.

There are variable stars of types other than

There are variable stars of types other than those like Algol. The Cephcid variables have an average period of about 7 days, and the rise from minimum to maximum takes only about one-third of the whole period, so that the decrease of light is more gradual than the increase. It has been suggested that this may be due to a pulsation or periodic swelling and contraction of the star. A peculiarity of these stars has been

mentioned (see page 64). Stars of the ß Lyres type pass from minimum to minimum in about 6½ days, but are not of the same brightness at all minima, the alternate being equal. There are variable stars with periods ranging between 30 and 500 days whose difference of brightness during a light-cycle may be as great as 9 or as magnitudes. The spectra of most of these long-period variables show bright emission as well as dark absorption lines, and a periodic outflow of incandescent gases and vapours is suggested as the cause of the light variation. Mira Ceti (R.A. 2d. 150m., Declination 3° 18' S.) is the most famous of these. It will probably be at maximum in April of this year, when it will not be visible Its magnitude at maximum may be anything between a and 5, and at minimum, 9 or 10.

between s and 5, and at minimum, 9 or ro.

There is a group of 8 or 9 stars of a remarkable type known as the U Geminorum which for most of the time are of uniform or nearly uniform magnitude, but un'ergo periodic outbursts which generally last a few days. The majority of this group are of suth or such magnitude at maximum, though U Geminorum itself is of the 9th, and the mean range in manuitael is about 4½. The outbursts may be said to happen every so or 30 days, but this period is frequently much exceeded SS Cygni is included in this group, though its variation is very erratic. Also there are a few variable stars whose characteristic is the opposite of that of the class just mentioned; they are ordinarily bright, but sometimes become faint without warning and remain so for a year or more, varying very irregularly until they again attain their normal brightness. The star R. Corone Borealis, normally of magnitude 6's, which gives the name to this class, has been observed since the year 1843, and up to the year 1945 forty well-marked minima had been recorded, ranging between magnitudes 7 and 15 in brightness and from 2 months to 18 years in duration. A variable star with the remarkably short period of rather more than an hour and a half has lately been discovered.

NEW OR TEMPORARY STARS.

The phenomena known as "Novae" or "New" Stars can scarcely be classed as variable stars, for the rise to maximum, so far as is known, occurs only once in their history. Generally the Nova appears in the place of a star of faint magnitude which may have blazed out into confiagration, but on the other hand the juxta-position may be merely fortuitous and the phenomenon may be the sudden visibility of a mass of dark nebulous gas which by some means has become igneous. The great brilliancy, which occurs very suddenly, is short-lived, for there follows a rapid fall, and in a few months the object emits, perhaps, z per cent. of its light, whilst in a decade it falls to xoth or zath magnitude or fainter, and in some cases shows a decided variability. About thirty bright stars of this kind visible since the time of Hipparchus zz4 B.C. are on record. A list of z3 that have been seen since z245 will be found in previous issues of this Almanack, together with an account of the changes in the spectrum that have been generally observed.

spectrum that have been generally observed.

No convincing reason for these phenomena has yet been given. The speculation has been put forward recently that novae are explosions of white dwarfs, and another that a faint star collects a covering of gaseous inter-stellar matter.

DOUBLE AND BINARY STARS.

The large majority of stars when looked at through a telescope appear as single points of light of different degrees of brightness and perhaps differing slightly in colour. Some, however, are seen to consist of two points, so close together that the duplicity is shown only by telescopic examination and the measurement of the relative position of the components forms a branch of observational astronomy. This duplicity would happen if one star lay in space immediately behind the other; but there are more double stars than would accrue if this were the only reason, and it is evident that the greater number of double stars are formed by components actually near together, which, it is likely, have a gravitational connection. This idea of connection was not held in early days and Sir Wm. Herschel who, in 1779, was the first to begin their systematic observation, was careful to call these pairs Double Stars, not wishing to imply anything more than nearness, though by that date it had already been suggested that two stars seen near together were actually contiguous and formed a physical system. Twenty years later observed changes in the relative position of the components of some double stars led Herschel to adopt this idea, and he used the word Binary as the name for those known to have physical connection. It is clear that limits of distance must be set, and, in general, a separation between the components of less than about 30 seconds of arc defines a double star. As to the lower limit it is found possible with a large telescope to measure distances between two stars as small as a fifth of a second. There are in the sky rg,000 to 20,000 stars between these limits that have been measured and catalogued. The number is given vaguely for it is being added to continually, a certain private observatory in the North of ponents of Castor are said to be both yellowish-England, for example, contributing a hundred or moreto the list annually. \(\zeta \) Ursae Majoris (Mizar) the middle of the three stars that form the tail of the Great-Bear as considered to be the first double Star discovered (1650). Its components of and and th magnitude are separated by 15 seconds the last a chappanion, Alcor, of the magnitude freminutes distant that can be seen separately by the naked sys, but this does not come within the companion of

other and various combinations of magnitude. Observations of Mizai, extending over 150 years, do not show any change in the relative position of the components, but from similar measures of the other stars mentioned, it is deduced that the twin components are moving round one another in elliptic orbits. In the case of γ Virginis the orbit is completed in about 180 years. Other visual binaries have periods that lange from to to 250 years, but a method (see below) other than direct visual observation reveals the existence of binary stars revolving in orbits in periods that may be a few days or only a few

SPECTROSCOPIC BINARIES.

As mentioned on p. 65, it is possible, from certain peculiarities in a star's spectrum, to deduce the speed with which any star is advancing towards, or receding from, the earth. As a result of their motion around one another, the two components of a binary star will, in general, be respectively advancing towards, and receding from, the earth at different rates, and when both components are bright enough for when noth components are origin change, for their spectra to be visible, the spectrum of a binary star shows two distinct sets of lines, which oscillate about their mean position in a puriod equal to the period of the star. There are many stars of this kind with components so close together that they cannot be seen as two visually, but whose orbit may be determined from observations of their spectrum. Such stars are called Spectroscopic Binaries. One recently discovered, known as Plaskett's star, B.D. 601309, has a period of 14'41 days, and is the most massive and brightest star (absolute magnitude) whose elements are known.

Colours of Double Stars,-The components of close double stars that differ little in brightness show little or no contrast in colour. green by one observer, and by another bright-white and pale-white. The components of y Virginis are both pale-yellow to one observer, silvery white and pale yellow to another. The components of of Eridani of magnitude 9:2 and to z are both blue. Following are some examples in the opposite sense. The stars named are all physically connected and have had their orbits computed-the magnitudes of THE Sun is one of the millions of stars that make up the Universe, and, so far as human knowledge goes, in magnitude and constitution, is not unlike the stars of the night sky. It is surrounded by a family of smaller bodies of which our Earth is one, and the Solar system, which is only a minute detail in the structure of the Universe, is the observing station from which we look out in all directions across the great distances which separate us from the other members of the stellar system.

The Solar or Planetary system consists of the Sun, with eight major planets, and minor planets or asteroids, that may be counted by thousands, circulating round it at varying distances in oval-ahaped orbits. A moving object discovered in the year 2930 is said to be a ninth major planet (see Pluto, D. 21). Six of the major planets have amaller bodies disculating around them, so that each forms a separate system, but all the bodies receive their light and heat from the Sun

The periodic comets which return to perthellon at regular intervals may be considered to be members of the Solar system, since they move in elongated elliptical orbits of which the Sun is at a focus. It is likely that their light is reflected sunlight, since they become brighter as they approach the Sun, but also that they are partly visible by their own light.

The plane of the Ecliptic in which the Earth moves round the Sun (see p 28) is used as a fundamental plane of reference. The other planets move in planes inclined but little to the plane of the Ecliptic, at varying distances from the Sun, and describe orbits in periodic times which are connected with the distances by a certain relation known as Kepler's 3rd law. The squares of the periodic times vary as the cubes of the semi-major axes. Following are given brief notes on each of the bodies which make up the Solar system, with details of their sizes, distances from their primary, and periodic times in tabular form (pp. 73, 74). The time of rotation about its axis, or the length of the day of the planet, is added when this is known.

THE SUN.

The surface of the Sun, seen in a telescope, presents a mottled appearance formed by a darkish background on which small brilliant patches are scattered, the shape of these being such that they have been called alternatively rice-grains or willow leaves. On this surface, or amid the material forming it, black spots appear sporadically, and around them are brilliant streaks called faculae, which are conspicuous when the spots are near the edge of the Sun. Bright and dark streaks unassociated with spots, generally called flocculi, can be seen in the central parts of the disc with a spectrohelioscope. There are also brilliant clouds of calcium vapour pervading the solar surface that are revealed by a device called a spectroheliogroph, by which the whole of the Sun's disc may be photographed by the light of any element, and of that element only. Modern views describe the spots as columnar vortices which have a deep-seated origin far below the photosphere, and assume that a sunspot is a vast tornado in which electrified particles are rapidly whirled, as is proved by the presence of a magnetic field. The spots vary in size and number, and increase and docrease comewhat uniformly in both respects, passing

through a maximum about every eleven years. They increase at a rather more rapid rate than they decrease From measures of their position on the disc and by help of the elements given on page a of each mouth the latitude and longitude (heliographic) of the spots can be computed. It is seldom that spots appear in latitudes greater than 30° from the solar equator, but about the time of spot minimum or rather earlier small spots appear in even more extreme latitudes, and during the succeeding eleven years the spot regions converge towards the solar equator (Sporer's Law of Zones), and at time of maximum the spots are largely in solar latitude xs' to xs' N. and S. The periodicity was first noted by Schwabe, of Dessan, in the year x8x3 from a comparatively few years observations, but records of collisions of the statement of the cords of earlier years and a continuous and complete record made subsequently prove the existence of a period of average length of xx1 years from maximum to maximum, though there are large variations from this mean as shown by the table below. The prominences (v. infra) also show a fluctuation in their activity in a period of the same length, and the form of the solar corona changes with the Sun-spot cycle in a most marked way. Not only this, but there are some terrestrial occurrences that vary in like some terrestrial occurrences that vary in like phase with these solar, which seems to show convincingly a connection, or at any rate a relation, between Sun and Earth (see page 76). The Sun rotates on its axis in about 25/2 days, which is shown by the movement of the spots across the visible disc, but because the Earth has moved in its orbit in that time the period of rotation with security to the Earth has Suncelland. mas moved in the orbit in that time the person or rotation with respect to the Earth, the Synodic period, as it is called, is 27% days, and a spot may therefore be on the visible disc for 13 or 14 days. These are approximate mean values, for the Sun does not rotate as a whole solid hody, and the rate of rotation is not the same in all latitudes. A formula derived from the Green-wich record of spots during the period 1878-1923 gives for the time of sidereal rotation in different latitudes :-

			d.	h	!			đ.	ħ.
Equator Lat. 5°	• •	••••	25	1	Lat	150		25	8
lat. 5			25	2	,,	200	٠.	25	14
,, ro ^o	••		25	5	١	300		. ≥6	6

These figures refer to both hemispheres of the Sun. The addition of a days gives approximately the period of rotation with respect to the Earth.

DATES OF SUN-SPOT MAXIMA AND MINIMA.

Maxima.	(1	Mini.	mu.	
1805 2	2870 · 6	19	10.Q	1808.0
1816.4	1883. ð		-3 ′3	188 ₉ 6
1820.0	x894 · x		33.8	1901 6
1837 2	2906 4		43.2	1013.1
1848.1	1917 7		20.0	1923.Q
1860 r	x927'5	28	67'8	

The maximum of which the date is generally given as 1927 3 was not sharply defined, but was shown by a double peak in the curve of spotted area. There was a general decline in the spotted area in 1921. The spots were mainly small, and on some days there were none.

When the intense light of the Sun is abut off by the interposition of the dark body of the Moon in a total solar eclipse, appendages called prominences that are generally described as reddish coloured, but appeared white from

aeroplanes on the occasion of the eclipse of rest, June so, are seen projecting from the Sun's edge. These consist of masses of glowing hy-drogen gas arising from the chromosphere, being sometimes of remarkable shape and extending to enormous heights, and are occasionally detached from the body of the Sun. It is possible to observe these at times other than when the Sun is eclipsed. In the lower strata of the Sun's envelope are found the vapours of many metals, known by their characteristic lines shown in the spectroscope. Another appendage of the Sun outside the chromosphere, called of the Sun outside the chromosphere, called the Corons, can only be seen during total eclipses. The lower portion of the corona con-sists of a pale green light containing hydrogen; the upper is a beautiful mass of silvery white light, in form of feather-like plumes, with dark spaces between, which have been traced from the Sun's edge to a distance as great as twice the Sun's diameter. The corona appears to vary in shape and extension according as the eclipse occurs at the period of maximum or minimum of Sun-spots. At the eclipses of 1929, May 9, and 1930, October 21, it was of intermediate type. Solar eclipses are total only when seen from places on which the shadow of the Moon fails, and an eclipse is seen partial from localities not far from this path of totality, because the change in the observer's position places him out of the cone which envelops both Sun and Moon. There are more solar eclipses than lunar in the proportion of four to three taking the whole earth into account; for any given station the proportion is more than reversed.

MERCURY.

Mercury is the nearest planet to the Sun, and the smallest in the system. Because it moves in an orbit between the Sun and the Earth this planet. can never be seen far from the Sun, but is always at a short distance to the West or to the East of that body. In the former case Mercury appears as a morning star and in the latter as an evening star. The extremes of these apparent excursions are known as Greatest Elongations, and their times and the distances, measured by the angle included between the lines which join the Easth to the Sun and the planet respectively, are given in the third page of each month. The great ellipticity of the orbit of Mercury causes the amount of these Elongations to vary considerably, and they may be as small as 16° or as large as 8°. Eastern elongations, when the planet is seen as an evening star, occur at intervals of about 176 days, as do Western, and the best opportunities of seeing the planet are before the Eastern elongations in the sutumn. This year Mercury is likely to be visible as an evening star in March, and in the morning in the early part of September and at the end of December. Mercury shows phases to the Earth like the Moon in her first quarter if the elongation in the Section be in the East, and like her last quarter if in the West. (See p. 73.)

VENUS.

Venus, which is nearly twice as far from the observers, but not by of Sun as Mercury, its distance from the central body being rather more than two-thirds that of the Earth, is almost exactly the same size construction, but for the so our globe. Her apparent movement with respect to the Sun is similar to that of Mercury, munication with Mars, tecept that, being farther from the Sun, and nearer to the Earth than her smaller neighbour, telegraphy, is fautastic.

the angles of Elongation exceed those of Mercury, and extend to 47° . Writing generally, it is believed that the planets rotate on axes as does the Earth, but this is not known to be the case for the interior planets Mercury and Venus, because of the difficulty in seeing any markings on their surfaces that may be considered permanent. Attempts to discover the rotation period of Venus have shown that it may be about as or a4 hours, or a4 days, or asg days which is the period in which it completes its can scarcely be said that any period is proved. A scheme, practised in America, of photographing through screens of columed plass (see Mars below) applied to this planet leads to the suggestion of an outer covering of cirrus cloud, and markings seen on the photographs taken in ultra-violet light appear to indicate a period of rotation of 30 days. This planet will be brilliant and constitutions in the evening sky in the first half of this year, and in the morning in the latter half. Her conjunction with Jupiter on Oct. so is to be noted. (See p. 40).

1.F A 10.0

Mars, the first planet whose orbit is exterior to that of the Earth, is a little larger than Mercury and considerably smaller than Venus and the Earth. Details of his distance, size, and period will be found in the table. Mars is nopposition at intervals of about two years, because it moves at a rate not greatly different from that of the Earth. It will not be in opposition in 123, March 1. Though the planet will be well situated for northern observers so far as altitude is concerned, it will not be a favourable opposition as to its distance, its diameter being only 14" as compared with 15" in 1294 when it was in opposition in August. Mars, like Mercury and Venus, exhibits phases, but in a much less degree than those planets. Its disc departs from exact circular form, or is gibbous, only to the extent of one-eighth of its diameter. The other auperior planets are too far away to show very appreciable phase, though traces of it are sometimes to be detected in the disc of Jupiter.

Unlike Mercury and Venus, Mars exhibits many well-defined mankings, which enable its

Unlike Mercury and Venus, Mars exhibits many well-defined maikings, which enable its rotation period to be well ascertained. There are white spots at the poles of rotation that appear to be snow, or some material that melts, since they dwindle, or even disappear in the Martian summers. The remainder of the surface of the disc is made up of dark bluish-grey areas that were at one time thought to be water but are now regarded as regions covered with vegetation and extensive areas of ruddy or orange hue, largely in the northern hemisphere, that may be of the nature of sand or rock. These markings may be considered permanent, though they suffer small changes apparently due to cloud formation above them. Among these markings are some of such dimensions that they may be properly called "canals," but certain fine, straight markings seen by some observers, but not by others, have received this name, which is certainly unfortunate, as it has been taken to imply that they are of manual construction, but for this there is no sufficient evidence or proof. The possibility of communication with Mars, which in some, minds has been strengthened by the advent of wireless

A method of investigating the surfaces of the A nachood of investigating the surfaces of the planets was evolved a few years ago by photographing through "colour filters." The light before it reaches the plate, which is of suitable sensibility, passes through a coloured screen that absorbs the component rays of certain wave-length so that one colour only affects the plate. The moon, the planets and terrestrial landscapes have been photographed in this way, and compared on if the various results has auglandscapes have been photographed in this way, and comparison of the various results has suggested an interpretation. In the case of Mars the telescopic features as described above come out very strongly in red light, but fade away as the colours approach the violet end of the spectrum except that the white polar cap increases in strength, all of which is interpreted as showing that Mars has an atmosphere of considerable depth and obscuring power, sporadically cloud-hearing, and that the white polar spot is an atmosphere on Mars has for long been a matter of discussion, and to this these experiments form a valuable contribution, they may not supply a final answer. The two satellites of Vars, Phobos and Delmox, were discovered by Asaph Hall in 1877. Their names were adopted by the discoverer on the suggestion of H. G. Madan, the science master at Eton.

MINOR PLANETS.

Between the orbits of Mars and Jupiter there are a large number of small planets, and every year considerable additions are made to the list. year considerable additions are made to the list, a hundred and sixty-two having been found in the year 1930. At present the total is about two thousand, more than a thousand being on the "permanent" list as fully investigated. There may still be thousands awaiting defeation. The four largest, found in the early warrant of the still warrant to the still warrant of detection. The four largest, found in the early years of the 10th century, are—Ceres, 485 miles; Pallas, 304 miles; Juno, 218 miles; and Vesta, 345 miles in diameter. Some of them are perhaps nothing more than great masses of rock flying round the Sun.

The periodic times of their revolutions vary considerably, and an average may be taken as 1,500 days, or 4½ years. Some of the orbits are very oval, and the inclination of their planes to the Ecliptic has considerably different values the Ecliptic has considerably different values. The inclination of Pallas is 35° whilst that of Juno is only 73°. One of these small hodies, Exos, approaches very near to the Earth at some oppositions, which affords a good opportunity for determining the solar parallax. An opposition of this kind occurred early in the year 7337, the of the solution when the minimum distance was about 16 million miles.

JUPITER.

The next planet in order from the Sun, Jupiter, The next planet in order from the sun, Jupiter, is the largest in the system, and has a diameter eleven times that of the Earth. Its density, however, is only 1/2 th that of the latter. On yelwing jupiter through a telescope it will be seen that the disc is not circular, but its form, an oblate spheroid, is believed to be due to the rapid axial rotation, which causes a flattening at the poles and bulging outwards at the equator. The same effect is produced on all the planets in more or less degree.

Jupiter has four principal satellites about the same size as our moon, or so per cent. larger, which were the first relestial objects discovered with the telescope, Galileo having observed them in the year zero. Simon Marius, however, claimed to be their independent discovers. It has also

,

five much fainter satellites which are far beyond the powers of small telescopes. One of them was discovered with the 35 inch refractor at the Lick Observatory in 1892. The remaining four, which are extremely faint, were detected by means of photography and may be regarded as among the most difficult to see of celestial objects.

The characteristic surface features of Jupiter are the bright zones separated by dark belts to both of which the names Equatorial, Tropical and Temperate apply in analogy with the zones on the Earth. Examined by telescope these are found to be full of detail and markings which, found to be full of detail and markings which, though they may be atmospheric, are largely permanent but undergo changes. Of these the best known is the Great Red Spot and its surroundings situated on the southern edge of the south Equatorial Belt. There are records of an observation of a spot by Hooke in 1664 which may have been an early appearance of this; the Rev. W. R. Dawes figured, it in the form of an ellipse resting on the south equatorial belt of Juniter on Nov. 22, 1822, and in 1888 it can under Jupiter on Nov. 27, 1857, and in 1878 it came under general observation. A curious bay or hollow in the above-named belt was noted by Schwabe in 1831, and is still seen. The mean rotation in 1831, and is still seen. The mean rotation period of this object and of the red spot near it has been found to be 9h. 8m. 37s.

The rate of rotation of the planet is found by

taking transits of spots or, in other words, by noting the exact times when markings are on the central merdian, and differences in the times given by different markings is a matter of interest. During the spparition of vasa-30 a long group of dark spots appeared at the south long group of dark spots appeared at the south edge of Jupiter's North Temperate Belt, which gave the remarkably small rotation period sh.'49½m., which is less than that of the fast-moving Equator (see below). This is the third occasion on which rapidly-moving dark spots have been detected in that latitude of the planet, the others having been in 1880 (sh. 48m., Denning) and in 1891 (sh. 49m., Barnard, Hough). On the other hand, an observer in the early part of 1993 found a dark hump on the R edge of the S Equatorial Belt with the shnormally long period of 'ch. 59m. Apart from such unusual cases the surface of Jupiter, like the Sun, does not rotate as a whole, but individual zones of latitude appear to move at different rates. Two latitude appear to move at different rates. Two intitude appear to move at different rates. Two systems are in use for defining the positions of markings on Jupiter. In System I, which per-tains to the rapidly moving Equatorial Zone of the planet, the period of rotation is taken as obsom, 3°0s. System II applies to the Temper-ate Zones, and in this the time of rotation is oh. 55m. 40.638.

SATURN.

The sixth major planet in order from the Sun is unique in appearance because of its entircling ring-system, which renders it magnificent as a spectacle and an interesting object for telescopic spectacle and an interesting object for telescopic observation. The system consists of two bright thus and an inner dusky ring through viliptic the body of the planet can be seen. A marking of the outer ring known as Encke's division is sometimes seen, but it is doubtful whigher this is a real separation. The rings appear to be flat annular discs of extreme thinness, in the same plane which is included as to the plane of the Ecliptic, and it is shown that neither of them can be a coherent mass or in one piece either solid or liquid, as in that case it would be dimonlit to account for their stability. They probably consist of an immense number of minute bodies consist of an immense immense of induce to de-revolving like satellites gound the body of the planet. Belts like those on Jupiter, but of not so pronounced a character, are seen on Saturn-Photographs of this planet, taken by ultra-violet light show a wide dark belt near the equator which may or may not be an extension of the dusky ring. Saturn shows a bulging at or the dusty ring. Saturn shows a building at equator, the ratio of the polar to the equatorial diameter being as 13½ to 15, an eccentricity of the ring with respect to the Ball has been suspected. Saturn has ten satellites, situated outside the

rings; some of the former are visible in telescopes of low power. Titan, the largest, is about one and a half times the size of our moon, whilst lapetus is nearly the same size as our satellite.

lapetus is nearly the same size as on section.

Titan was discovered by Huyghens in régs,
Tethys, Dione, Rhea and Lapetus (see table p. 73)
by J. D. Cassini towards the end of the 17th
century. Sir Wm. Herschel discovered Mimas. century. Sir wm. Hersonel discovered animas and Enceladus in 1726, and Hyperion was observed for the first time, almost simultaneously by Bond and Lassell, in September 1848. The most distant, Phobe, which was first seen in 1858 (photographically by W. H. Pickering), moves in its orbit in retrograde direction like the two exterior satellites of Jupiter, VIII. and IX. Themis, which is called the tenth satellite, though it appears not to be the farthest from Saturn, has been observed once only since its discovery in z900, and its reality is doubtful.

This planet, discovered by William Herschel at Bath in 1781, is only just visible to the naked eye. It will be in the evening sky in the carly months of 1932 and at the end of the year, being in opposition on October 14. In a telescop.
Uranus is distinguished from the stars around by its disc, which is obvious though less than 4" by its disc, which is obvious though less than 4" in diameter, and by the quality of its light, which is less piercing than that of the stars. The two outer and brighter of its four satellites were discovered by Wm. Herschel in 1787; the two inner by Lassell in 1851. Their names, Ariel and Umbriel, were taken from Pope's "Rape of the Look" A hundred years ago it was thought to have six satellites neighbouring stars. thought to have six satellites, neighbouring stars having been mistaken for attendants. All four move in a plane which is inclined 82° to the plane of the ecliptic and in that plane they move retrograde, or in the opposite sense to the revolution of the planets round the Sun. If, however, the plane of their movement is regarded as revolution may be considered direct. It is generally supposed that the plane in which the satellites move is that of the planet's Equator A period of rotation has been determined both by spectroscopic observation and from variations of light of the planet, the value, 10% hours, being sensibly the same in the two cases.

NEPTUNE

This planet is a telescopic object of about the 8th magnitude that was discovered in September sati magnitude that was discovered in september 1846, as the result of mathematical deduction from irregularities shown by the observed positions of Uranus. Its single satellite, which was discovered by Lassell in October of the same year, moves in a plane inclined 32° to the plane of the Ecliptic in a retrograde direction like the satellite of Uranus.

length from spectroscopic observations, which is adopted. Triton has been suggested as the name of Neptune's satellite, but is not generally used.

PLUTO.

The late Percival Lowell, from a study of the outstanding errors of the orbit of Uranus, pre-dicted the path and mass of a planet that moves in an orbit outside that of Neptune, and in the early months of 1930 a series of plates taken and examined at the Lowell Observatory showed a moving object not far from the position it should have had to accord with Lowell's prediction, but fainter than the object Lowell hoped to find. The first orbit computed was a very to find. The first orbit computed was a very eccentric ellipse with period of 3,000 years, and the idea came to many that the object was a comet. The photographic plates of many observatories were scauned in the hope of finding images in former years, and these were found (Ucole, 1927; Mount Wilson, 1929; Yerkes, 1921 and 1927; Königstuhl, 1924. These images have sufficed to prove that Pluto's orbit is not such more computing than that of Mount. much more eccentric than that of Mercury. The outstanding difficulty is to make estimates of its mass and size on which we may rely. The observed errors of Neptune's orbit are said to give definite evidence of Pluto's attraction, and that its mass is comparable with that of the Earth, but on this point there is not universal agreement. It is doubtful whether a measurable disc can be seen, but from its magnitude and distance it is estimated to be at least as large as Mars, and perhaps as large as the Earth. ising as mars, and permaps as large as the Earth. It shows no cometary appearance in the telescope. The period is \$45\$ years. The distance from the Sun at aphelion is nearly 50 astronomical units and at perihelion \$25\$ such units, so that it is just within the orbit of Neptune. The body moves in a plane unclined \$7\$ to the ecliptic. The orbit is said to be so similar to that product the Local that the resemble reserves. dicted by Lowell that the resemblance cannot be due to accident.

Assuming it to be a major planet, the name Pluto has been accepted by the Trustees of the Lowell Observatory. This was proposed by Miss Venetia Burney, of Oxford, aged 1x, a great-nicce of Mr. Madan, already mentioned (see Mars).

THE MOON.

Neither Mercury nor Venus, so far as is known, has a satellite; the one satellite of the Earth is the Moon, which is quite familiar to us. The mean distance of the Moon from the Earth is about 239,000 miles-near enough for us to get a more complete knowledge of its surface conditions than we can of any other member of the Solar system. Only one side of the Moon is seen from the earth, but every region of the Moon is presented to the Sun in turn, and neglecting hypotheses as to the possible existence of a lunar atmosphere and its effects, it seems likely that there are rather remarkable changes of temperature: in the lunar day of half a month it must be heated to an extreme degree, and in the other half subjected to cold equal to that of interstellar space. Her diameter is rather more than a, x6 miles. Her rate of motion through the firmament is x2° x0′ 32" per day, which implies that she travels over a space slightly exceeding her own diameter in one hour. satellities of Uranus. A period of axial rotation The average time from a New Moon to the next of the planet of 7% hours has been inferred from is 25d. zzh. 44m. 3s., but individual cases may variability of its light, and another of twice that range 6 hours and more on either side of this (see also p. 74). When seen through a telescope the surface of the Moon presents many objects of great beauty and interest. A small instrument will show the chief "seas," plains, mountain ranges, ring-plains, and crater-pits. The question as to the origin of these formations, whether they may have been caused by vole and action, or, on the other hand, by the impact of meteors, forms an interesting subject for discussion. (See p. 35.) The material of which the Moon is composed is probably the same as that of the Earth.

When the Earth passes between the Snn and Moon, the Earth's shadow sweeps across the Moon and causes a lunar eclipse, which may be either total or partial as in the case of solar eclipses, but there is the difference that the phase of a lunar eclipse is seen the same from all places where the Moon is above the horizon at the time Solar eclipses can take place only at New Moon, and lunar eclipses only at Mol Moon.

and lunar eclipses only at Full Moon (Sec p. 69)
The Full Moon which occurs near the Autunnal
Equinox rises at nearly the same time, about
sunset, on several consecutive evenings.
Because in earlier times it was thought that
this was specially ordained to facilitate the ingathering of the crops the phenomenon was
called the Harvest Moon. The Full Moon which
follows is called the Hunter's Moon

A FEW OF THE CHIEF LUNAR FORMATIONS.

Wedge-shaped Valley of the Alps — Near the central fine of disc, towards the north, a cleft 83 miles long and 3½-5½, miles by oad Apenaines — An extensive mountain lange some-

Apenaines — An extensive mountain range somewhat similar to ten estral features V sible to naked eye when projecting into the dark part of the disc. Length, 450 miles, highest summit (Huyghens) reaches 18,000 feet.

Aristarchus.—A lunar crater in N.E. quadrant The hightest object on the Moon. This crater is visible as a luminous spot when all the surrounding region is involved in shadow.

Mare Custum — A dark grey oval plain visible to naked eye near W.N.W. limb of Moon Extends 280 miles N. to 8 and 354 miles E to W. Well seen five days after new or a few days after full.

Mars Servitatio.—Lies S of the Moon's centre, and extends over 428 miles. A nearly circular dark plan: Contains a crater, Linne, formerly suspected of change. This mare is visible to naked eye

Clavius —One of the finest craters on the Moon, and about 142 nules in diameter. Situated on S. limb.

Tycho.—Towards S limb Has been called "the metropolitan crater of the Moon." A fine crater 54 miles in diameter and 16,600 feet deep. Cential hill nearly a mile high Tycho is the centre of a remarkable system of hight rays radiating from it, and they are very conspicuous at the time of full moon. In its region (8. limb) the Moon's surface is so studded with craters that it resembles an immense honeycomb.

COMETS

Comets that revolve in elliptical orbits round the Sun as focus, and return to view at periodic intervals, may be considered members of the Bolar system. The periods that have been confirmed by returns range from 3% to nearly Se years, whilst a few other computed orbits whow periods as large as a million years. (ther

comets move in parabolic courses and apparently do not repeat their visits to the Sun.

Those that revolve in periods from 3½ to 9 years are specially numerous. Their paths extend outward to the region of Jupiter's orbit, and from this circumstance they are termed Jovian comets.

Encke's comet, which returns unfailingly every 3½ years, and was due at perthellon on June 3, 1932, was observed on June 2, and subsequently. The periodic comet Neujmin, with period 27½ years, whose return was expected, was observed in September, some months after perihelion passage. Two unexpected comets were discovered during 1932 (up to 0 t. z.), neither of which appears

sage Two unexpected comets were discovered during regr (up to 0t. t.), neither of which appears to be periodic. One was unusually bright, being observed telescopically in the morning twilight, but did not make a spectacle for general view.

but did not make a spectacle for general results are computed to return to perihelmon in 1928. The list is subjoined with, in each case, the month of perihelmon in pressage. These are to be considered as approximate only, for soveral of the onlits are in course of re-calculation, and more precise information will be found in the publications of the British Astronomical Association—Schort (Jan), Grigg-Skelleung (May), Neujmin

1927 I (June); Wolf's and periodic (July); Ronselly (Aug.); Kopff (Aug.), Brooks (2) (Oct.); Tempel 1866 I (Nov.), Fuye (Dec.). There are other families of comets, none so

numerous as the Jovian, named respectively from the planets Saturn, Uranus and Neptune, for a reason similar to that given above Neujinin's comet that returned in roar belongs to the Saturnian family, while the comet of the November meteors (Tempel) belongs to the Uraman

METEORS

Another class of objects belonging to the Solar system are the meteoric streams, which give rise to occasional showers of meteors, falling stars, or fireballs, and are all the same class of object, the distinction being only one of size They are visible in varying number on every night of the year, and are sometimes so abundant as to form striking phenomena. There is some reason for the supposition that meteor swarms are the remains of discupted comets, and that Tempel's comet, that will return to perihelion perhaps at the end of 1932, is the parent of the Leonid meteors. A considerable display occurred on October 9, 1926, and a smaller one on Oct. 9, 1927, from a radiant at 262° + 52° in Draco, which appear to have been derived from

fore be in 1933, and meteors of the stream may be seen this year as they appear to be distributed over a considerable arc of the orbit. Fireballs form a very important branch of meteoric astronomy. These objects make their appearastronomy. These objects make their appearance at all times of the year, and are usually seen ensually by persons not looking for meteors or acquainted with the requirements of observation in regard to the phenomena, with the result they are often imperfectly described, which makes computation of their real paths not practicable At 5 o'clock in the afternoon of lanuary 17, 1931, in semi-daylight, a very builliant the ball was seen mainly from the west of England but also from places as far east as Aldershot, which was found from the observations, of which there were many to have begun its luminous fight at a point 85 miles above Pontypool and to have ended it zr miles above a point in the Atlantic Ocean 46 miles west of Trevose Head, Cornwall, having traversed 168 miles at the rate of 21 miles a second. If it was not already vaporised it would have fallen into the ocean 62 miles west of St Just
THE AURORA BOREALIS.

This phenomenon may be considered more terrestrial than celestial. It sometimes happens that an unusual luminosity is seen in the northern Guacolini's comet of 1500, that passed its perisky in the form of streamers, arches, and condensated no December 11, 1526, and has a period tions. This is regarded as showing the outer of about 6½ years. Its next return will there illnit of our atmosphere, and its height has been

determined by means of simultaneous photographs taken from two or more stations so to 60 miles apart. It is found that very few aurore . are below 50 miles high, and above that level the number increases rapidly, the most frequent height being at about 63 and 66 miles. Above 66 miles the number gradually diminishes, but some have been measured as high as 400 miles. It is suggested that the aurora is due to electrical discharge caused by charged particles shot into the earth's atmosphere from the Sun. An auroral display generally happens about the time of the occurrence of a terrestial magnetic storm (see p. 76) There is some evidence of a tendency for a display to be repeated after an interval of 29 days, which is the period of rotation of the Sun with respect to the earth, and they are more frequent at times of sun-spot maximum. A prominent line in the green in the spectrum of the aurora has given rise to much study and has lately been shown by laboratory experiment to be due to a mixture of oxygen and helium bombarded by high-speed electrified particles, but as this line has been found to be present in the light from the night-sky in non-polar regions when no aurora is visible it may be that this line is not directly connected with the phenomenon. THE ZODIACAL LIGHT.

This is an appearance whose cause is not completely understood, to be seen only from places distant from towns and cities where the air is free from smoke and the darkness of the sky is not affected by the glare from artificial lights. At such places in northern latitudes it shows, when the moon is absent, as a cone of faint light stretching up slantingly from the Sun before sunrise in the autumn months and after sunset in Spring. From high elevations in the tropics it may be seen throughout the year. A distinction is sometimes made between thus and the Zodiacal Band which is an even this and the Zodiacal Band which is an even fainter phenomenon and a prolongation of the Zodiacal Light. This is said to extend entirely across the sky, forming a complete ring, and there is at the point exactly opposite to the Sun a patch, a few degrees in diameter, of slightly brighter luminosity called the "Gegen-schein" or "counter glow." The Zodiacal Light has been said to be a were strongharte effect. has been said to be a mere atmospheric effect. but this is inconsistent with some of the chief features of its appearance. It may be the manifestation of a widely scattered appendage of the Sun or sunlight reflected from a vast concourse of meteoric systems.

Alternative names of stars (see pages 60, 61)-Polaris = α Ursae Minoris; Aldebaran = α Tauri; Rigel = β Orionis; Capella = α Aurigae; Betelgense = α Orionis; Sirius = α Canis Majoris; Castor = α Geminorum; Procyon = α Canis Minoris; Pollux = β Geminorum; Regulus = α Leonis; Spica = α Virgnus; Arcturus = α Bootis; Antares = α Scorpii; Vega = α Lyrae; Fomalhaut = α Plecis Australis; Altair = α Aquillae; Markab = α Pegasi; Achernar = α Eridani; Canopus = α Argus; Mizar = ζ Ursae Majoris.

Length of Month New Moon to New 29 12 44 28 (Mean Values) (Periges to Periges)

Duration of Light and Darkness.—The second column of the first page of Calendar for every month contains a small diagram showing the amount of Darkness, or the period of moonlight and sunlight during the twelve hours from 18h. to 6h. These small diagrams have four divisions, each representing three hours, and a division is left unblacked if the moon or the sun is above the horizon for at least half of the period it represents. The diagrams for the greater part of the year

x8 to ax x8 to a4 x8 to 3 x8 to 6: which reduce to in the summer.

THE shape of our Earth is that of an oblate spheroid, or a solid of revolution whose meridian sections are ellipses not differing much from sections are ellipses not differing much from circles, whilst the sections at right angles to these are circles. The length of the Polar axis, according to a recently socepted determination (Hayford) is 7,900 o miles and the diameter of the Equatorial circle 7,925 y miles. The suggestion has been made that the Equator is not an exact circle, but the supposed deviation from circulative reasonable and the fact has real been the continuous modifications and the fact has real been larity was small, and the fact has not been larity was small, and the fact has not been proved. The mean density of the Earth is 5.5 times that of water. The Earth moves round the Sun in a plane which passes through the Sun's centre, or, to write with more precision, the centre of gravity of the Earth and Moon moves in this plane, and both revolve round the centre of gravity but not precisely in the plane. The plane is called the plane of the Eclutic. The Earth's Equator is inclined to this plane at an angle of 23½°, and it is this tilt which causes the seasons. At some time of the year the Sun is high above the Equator in mid-intrindes both north and south, and not only does the high attitude make the days longer, but the Sun's rays fall more directly on the Earth's surface and make it hotter The periods of Summer and Winter are opposed in the two hemispheres, the time of Summer in the Northern coinciding with Winter in the Southern, and nice versa. Since the axis of the Earth is inclined always in the same Since the direction, the line of intersection of the Equator with the Ecliptic moves parallel to itself as the Eath travels round the Sun (approximately). The instants when this line passes through the Sun are called the Equinoses The Sun and Earth are surrounded on all sides by the stars, and because the Earth moves round the Sun, the latter changes its position with terpect the latter changes its position with tespect to the stars during the year, and different sets of stars are seen in the sky at midnight in Summer and Winter, The average velocity of the Earth in its orbit is 18½ miles a second, and it moves more slowly in July than in January. It makes a complete rotation on its axis in about 23 hours 56 minutes of mean time, which is the sidereal day. Because of the movement of the Earth in its orbit the length of the solar day is more than this by about four minutes (see pp. 57, 77). It has been shown almost conpp. 57, 77). It has been shown almost cou-clusively in recent years that the axis of rotation is not a fixed line in the Earth, but that its extremity, or the North Pole of the Earth, moves in a curve, roughly spiral, about the pole of figure as centre at a distance of a few feet from it.

THE TIDES.

The Tides of the Ocean are rightly attributed to the attractive influence of the Moon on the Ocean, notified by a similar influence of the Sun, which is less in amount because of the much agreeter distance of the attracting body. If the Earth were a globe uniformly covered with which it would be possible to account for the observed hipenomena and predict them by simple mathematical consideration of these attractive influences, but these are very greatly modified by this limid formations of our globe, and the prediction of the tides for any port depends mainly on the results of observation. A series of observed times and heights of the tide having been completed and analysed, the analysis will show that the complete tidal movement can be represented by the combination of a

series of periodic terms, and if these terms are each carried forward to some future date their recombination will give the predicted tide. Taking the mean sea-level as datum, writing generally, at any place high water occurs twice in every 24 hours, the interval between successive happenings being 12 hrs. 25 mins. High water is at its highest (springs) at or near New and Full Moon, whilst low water falls an equal amount below at those times. At or near the time of the first and last quarters of the Moon (neaps) the high water rises only about half as much above the mean level as it does at springs, and the low water falls about half as little below it. These phenomena do not usually coincide exactly with the times of these plusses of the Moon, but occur later, the interval being known as the age of the inde—thus, at London Bridge, the highest or spring tide occurs 2% days after New or Full Moon, and the neap tide is similarly delayed. The difference of height of spring and neap tides is the most apparent of the periodic differences which make up the whole tidal variation. Besides this there are differences due to the varying distance of the Moon from the Earth, and when the Moon is at or near perigee at New or Full the tide is specially high. There, is a slight difference in the heights of the spring tide at New and Full Moon, and also in the height of the neap tide at the respective quarters, but these and other small periodicities are not appreciably noticeable at some ports. The mean level of the sea remains practically constant, but small changes have been detected which may be assigned to various causes

TERRESTRIAL MAGNETISM.

The best known manifestation of this phenomenon is its effect on the needle of a mariner's compass, which, except for the variations to be immediately described, points continually northward. The north point indicated by a compass needle is not, except in particular cases, the north point shown by astronomical observations; in other words, the needle does not point to the North Pole of the axis of rotation of the Earth, but makes an angle with the terrestrial meridian. This angle is called the Magnetic Variation, or, more generally, Magnetic Declination, and differs in different parts of the world and even over limited tracts of country. Lines of equal mag-netic declination run across the British Isles in directions approximately parallel to that of a line from Land's End to Edinburgh. Along a line joining Cambridge to Littlehampton, the declination (West) is, approximately, the same as at Abinger. At Dover it is now rather more than a degree less; from Newcastle to Plymouth it is nearly 1/2 greater, and along a shahtly curved line from Killarney to the island of Lewis the west declination is 5° greater than at Abinger. There are two points of convergence on the globe known as the Magnetic Poles. At these points a freely suspended magnetic needle would stand vertically. The evidence available shows little, if any, recent movedence available shows intile, it any, recent movement of the North Magnetic Pole, whose position inferred from the Admiralty Chart of equal declination of 1921 is lat. 71°, long. 96° W., which is almost the same as found by Ross in 1821. There is some suggestion of eastward movement of the South Magnetic Pole, whose position in 1927 was lat. 73° S., long. 158° E. A scientific exploration of polar regions is being made this year, which may supply information on this point. The magnetic declination at any. place changes gradually year by year. That the compass needle does not in general point true north and south, but that it is inclined a certain north and south, but that it is inclined a certain amount east or west, and that the amount varies with the locality, was recognised among western nations by the end of the 15th century, Columbus being credited with the discovery. The Dip or inclination to the horizon was first noticed by Hartmann, of Nuremberg, in 1844, and was measured by Norman, of London, in 1876. That there is a continual change in the magnetic de-clination was discovered by Gellibrand in 1834.

Magnetic Declination at London.

CET.			
580	11	15	East.
665	¥	30	West.
76 <u>5</u>	20	٠,	West
Boo		0	West.

In 1819 the westerly declination at Greenwich was about 24° 25', which was probably its maximum. The needle has been since moving slowly eastward at that place, and in the year zess the declination (mean) was observed to be 13° 10'0' West The work of recording earth-magnetism was then transferred from the Royal Observatory, Greenwich, to Abinger near Dorking in Surrey. The values of the elements there found in successive years are given in the following table ---

·				
Year	Dec	нг	V F.	Dip
	1			
1925	13 25 7 W	*z86o	42946	66 35 I
1927	12 58 4	18575	48938	66 36 a
1989	xa 35 8	18555	48918	66 37'2
1930	IS 24 6	18542	'48924	66 38 2
1931	12 13 5 12 25 W.		'4 293 0	66 39.3
		· ·		•••

The values for 1931 are to be taken as provisional, and the declination given for 1932 is inferred only. V.F. signifies vertical force. V.F. signifies vertical force The mean differences, Abinger minus Greenwich, for Dec. H.F. and Dip. are found to be-

The daily movement in declination of the needle at Abinger is a or 3 per cent. less in amount than that at Greenwich

The declination varies during the 24 hours, for the needle makes a small excursion in the morning from East to West, and returns, the range at Greenwich being about zs' in summer range as directively length and the summer and y in winter. The needle occupies its mean position in the morning about xet, and again about xet, throughout the year. It reaches its most westerly position during the night or early morning the state of t ing at a time which varies during the year. The inclination or dip also varies in a similar manner to the declination. Since these changes of the magnetic elements are greater during the hours of daylight than in the night, are much greater in summer than in winter, and are evidently affected by changes in the solar activity—for the daily range is larger at times of Sun-spot maximum than at minimum-it is to be concluded that they are dependent on

three elements sometimes make sudden and violent oscillations which may continue for several hours. Such an occurrence is known as a Magnetic Storm, and is accompanied by spona magnetic storm, and is accompanied by solving tuneous electric earth-currents, which may, if violent, interfere with telegraph working, and is often synchronous with a manifestation of the Aurora Borealis. A suspected recurrence of magnetic storms after an interval of sy days that would support the theory that they are caused by radial emanations from the Sun, which strike the Earth—the hose-pipe theory has been further investigated. It appears that this recurrence does not obtain in the case of the most intense storms, but that there is a tendency for a storm of minor degree to be followed by another of its kind after the period named, which is not easily explained. There is frequently, but not slways, a large spot on the Sun contemporaneously with a large storm, leading to the hypothesis of active areas on the Sun that may or may not be marked by a spot.

EARTHOUAKES.

Earthquakes, or earth tremors, are believed to be due to some form of fracture caused by the breakage of the Earth's substance under a growing strain, when the strain has passed a growing strain, when the strain has passed the breaking point. This gives rise to waves which are propagated through the solid sub-stance to distant parts of the Earth, and verti-cally upwards to the surface, sometimes with disastrous effects. The point where the fracture occurs and the earthquake originates is called the occurs and the earthquake originates is called the seismic centre, or origin, or focus. That part of the Earth which is vertically above this centre is called the epicentre. The waves transmitted through the Earth may come to the surface hundreds, or even thousands, of miles from the nundreds, or even thousands, of miles from the epicentre, and the times of arrival are recorded. The first indications on the seismograph are made by longitudinal waves (P), which are followed after an interval by direct transverse waves (S) in approximately the same path, but which travel at a different rate. From the length of the interval of time between the arrival of the (P) and the (S) waves, the distance of the epicentre from the recording station may be interred, and from three or more such distances it is possible to make an estimate of the position of the epicentre on the Earth's surface (see p. 33). There is no very certain method for determining the depth of the focus, but it seems that this may range from 50 to 450 km.

BRIGHTNESS OF THE NIGHT-SKY.

A research now in progress, not to be named as meteorological, though it deals with the surrounding of the earth, has for its first aim the determination of the amount of light in the background of the night-sky, spart from clouds or moonlight. The facts make it clear that this feeble illumination is not due to the collective light of telescopic stars, but suggests permanent visible layer in the upper atmosphere, Coheer-vations organised by Lord Rayleigh are being made in various parts of the world of the inten-sity of the light separated to show the blue, magnetic consistency are dependent on solar radiation.

MAGNETIC STORMS.

Besides these diurnal movements and their periodic variations, the magneta recording the consistency of the light components (see p. 74). Observations made under this scheme at the Cape of Good Hope and other elservatories show variations that may be proided, and a correlation with sunspot activity is suspected. Greenwich Mean Time.

APART from abstract and philosophical considerations, Time, in actual practice, is measured by the rotation of the Earth, and a solar day is the duration of a complete rotation of our sphere round its axis with respect to the Sun, which is rather longer than a rotation with respect to the stars because of the movement of the Earth round the Sun, which is not constant because of the ellipticity of the orbit. The length of the Solar day also varies because the axis about which Solar day also varies because the axis about winter Earth rotates is not perpendicular to the plane of its orbit. Clocks are adjusted to an average or mean solar day which is of uniform length and is divided into a4 equal hours. This is the basis of Mean Solar Time. The length of the Mean Solar day is constant, but that of the apparent, or the interval from one transit of the Sun across the meridian to the next, varies for the reasons above given, and it happens that the longest apparent solar day is about December 22, and the shortest about September 16.

A unit and method of measurement having been established, it is necessary to choose a zero. The zero adopted is the instant when a fictitious holy known as the Mean Sun, which is sometimes before, sometimes behind the real Sun, is on some chosen meridian. The time is called the Local Mean Time of any place through which that meridian passes. Usually some which that meridian passes. Usually some standard meridian, such as that of Greenwich, is chosen, and the time of that meridian is used throughout a whole country, and hence the expression Greenwich Mean Solar Time, or, more usually, Greenwich Mean Time, arises (see

Zone Standard Time, p. 78).

Apparent Solar Time.

The time shown by a sundial is called Apparent Solar Time, and is affected by the two causes mentioned, which make the length of a solar day not uniform. It differs from Mean Solar Time by the Equation of Time which is given in the second column of page a for each mouth, with a precept for its use.

The Astronomical Day.
For purposes of Astronomy the day formerly began at noon, and the hours following noon were numbered successively from a to a3. A change was made in 2925, and the Astronomical Day now begins at midnight, the hours being num-bered in this way as has been the practice in this Almanack since rost. (See Note, p. 4.)

Rhythmic Time Simuls.

For the purpose of comparing the time shown by a distant clock with that of the Greenwich standard, signals issuing primarily from Green-wich are broadcast from the Post Office Witeless Station at Rugby each day at rot. and r8t. For accurate comparison a series of signals of the rhythmet, scientific, or Vernier type is sent. The zero signal is exactly synchronous with a best of the standard clock, and those that follow are at tatervals of 6e/6r seconds. The comparison is made by noting the coincidence of a beat out the distant clock, beating seconds, with a signal. If a tick of the clock coincides with the zero signal, it is clear that the clocks differ by an integral number of seconds. If, however, coincidence does not come at the zero signal, but at the ath following, the difference of the clocks contains a fraction of a second involving n/6x.

Sidereal Time. A sidereal day is the duration of a complete rotation of the Earth round its axis with refer-

First Point of Aries is on that meridian. observatory practice time is measured, and the standard clock is regulated; by this rotation of the Earth with respect to the stars, and Mean Solar Time is derived from Sidereal Time by computation. The error and rate of the sidereal clock are found by observing the instant it shows when certain stars, known as Clock Stars, cross the meridian, and comparison of this with the known time of transit (star's R.A.) will give the error of the Sidereal clock, and from this the error of the Mean Solar clock can be found by comparison and computation as below

The rule for finding the Mean Time of transit of any object from its Right Ascension, or, what is the same thing, of converting Sidereal into Mean Time may be stated thus .- From the given Right Ascension or Sidereal Time subtract the Adjust Assession or sucreal Time subtract the Sudered Time at the preceding Noon, and further dramach the result at the rate of 10 nece, per hour, or by the Table on p. 57. If the R.A. should be smaller than the S.T. at noon, 24h. must be added. The final result will be the mean time reckoned from noon, to which 12/1, must be added to convert into G C.T. as now used.

Ex—At what time will Sirius cross the meridian on August 31.

R A. of Sirius + 24h. ... 30 48 0 Sid. Time at Noon, Aug. 30 (subt) 10 33 52 Interval of Sidereal T. from noon ao 8 17 Retardation from p. 57 (subt.) 3 18

Summer Tune.

In 1916 an Act dated May 17 ordained that during a defined period of that year the legal time for general purposes in Great Britain should be one hour in advance of Greenwich Mean Time. An Act of ross (July 20), specified that the period should begin at 2 o'clock (4.M.T. in the morning of the day following the third Saturday in April, or if that day is Easter-Day, the day following the second Saturday, and should end at a o'clock G.M T. in the morning of the day next following the third Saturday in September. The Act, renewed in 1924 and reas, was made permanent (August 7, 1985) and modified by substituting the first Naturday in October for third Saturday in September. The Act applies to Great Britain, Northern Ireland, the Channel Islands, and the Isle of Man. hat of the periods in each year during which Summer Time has been used since its adoption will be found in this Almauack for 1926. In the last few years Summer Time has been

in use in France and Belgium during the same rotation of the Earth round its axis with refer-ence to the stars and begins at any place when the this arrangement will not be followed this year. In the year 1880 it was enacted by statute that the word "time," when it occurred in any legal document relating to Great Britain, was to be interpreted, unless otherwise specifically stated, as the Mean Time of the Greenwich meridian." Other nations similarly used the time of their own capital, but since the year 1883 the system of Standard Time by Zones has been gradually accepted, and now almost throughout the world a Standard Time which differs from that of Greenwich by an integral number of hours, either fast or slow, is used. In a few cases the difference includes a half hour.

The Standard Time adopted in various countries is given below. In the United States and Canada five standard times are used, these large territories being divided into zones approximately 7½° on either side of five central meridians. Brazili is divided into three zones in which the times 3, 4, and 5 hours slow on Greenwich are standard respectively. For the North coast of Siberia the hourly zones from za hours to 4 hours fast have been adopted.

Then through the centre of Bering Strait to spoint lat. 90 N., long, 280.

Chronological Motes.

THE AGE OF THE EARTH. In the view of science, any date for the "Creation of the World," such as the year 4004 B.C., as adopted by Archibishop Ussher from scriptural chronology, is quite untenable. From the assump-tion that its heat is sustained solely by contraction of its bulk, Lord Kelvin deduced so,000,000 years as the time that the Sun has existed, but this is too short to be accepted by geologists whose researches require a considerably louger time for the formation of terrestrial strata. The age of the Earth has been deduced astrorne age of the Earth has been deduced astro-nomically from the eccentricity of Mercury's orbit, and from the tidal theory of the origin of the Moon. Geologically by various methods, and, since the discovery of radio-activity, from active elements in rocks in the Earth's surface.

has existed as a planet for a period between 1,500 and 3,000 million years.

GEOLOGICAL PERIODS.

I. AZOIO("Without Life"), containing no trace of life in any form. The duration of this period probably far exceeded that of all the remaining divisions together.

which are held to result from the transmutation

of uranium. All the evidence is more or less consistent with the conclusion that the Earth

II. ECOMO ("Dawn of Life"), characterized by the first appearance of animal life. III. PALEOZOIC ("Old Life") or PRIMARY, con-taining traces of extinct animal life:—

i. Cambrian, exemplified in Wales (Cambria), Cumberland, etc. — the earliest group which possesses a connected suite of fossils.

ii. Ordovician, exemplified in North Wales and named after the ancient British tribe (Ordovices) inhabiting the region.

ini. Silurian, named after the ancient British

inhabitants (Silures) of S E. Wales. iv. Devoman or Old Red Sandstone, from the prevalence of the system as a marine formation in Devonshire.

v. Carbonsferous, including Coal Measures, Millstone Grit and Mountain Limestone.

vi. Permian, from the Russian province of Perm, where these strata are widespread. IV. MESOZOIC ("Middle Life") or SECONDARY,

with intermediate forms of animal life :i. Trassic, from the three (tri-) divisions of

the type formation in Germany 11 Jurassic, typically displayed in the Jura Mountains.

in Cretaceous, from the chalky nature of its representatives where first studied.

V. CAINOZOIC ("New Life") or TERTIARY, containing forms of existing life :-

i Eccene, the dawn or beginning of new forms of life, i.e., existing species.

ii Oligocene, containing a few still existing

iii. Miocene, containing a minority of existing apecies—less than so per cent.
iv. Plineene, the fossil remains show a majority

of still existing species.
VI. QUATERNARY ("Fourth in Order") or Post-TERTIARY :

i. Pleistocene or Glacial, the greatest number of the remains are those of still existing species. Period of last Great Ice Age.

ii. Recent or Post-Glacial.

Definite dates cannot be assigned to most periods, but G. de Geer has shown that scarcely 9,000 years ago the site of Stockholm was beneath

the ice-sheet (VI. i.). Traces of human life are first found in V. iv. (See also below.)

THE ANTIQUITY OF MAN.

Pithecanthropos erectus (Erect Ape-man).— Remains of a skull and of a thigh bone were found in 1891 and 1892 by Professor Dubois, at Trinii, Java. These are held to be remains of Trinil, Java. These are held to be remains of a creatme of Pleistocene times (see Geological Period, col. i.), about midway between the Orangutan and Man in development.

Sisanthropos pekniensis (Peking Man).—A skull found at Choukoutien, 40 miles S.W. of Peking, China (Dec. 2, 1929) (is ascribed to the same period as the Java type, but the brain development is greater than the Trinil skull and the brain case much thinner than that of the

Piltdown skull.

Australovithecus Africanus (Erect Man-ape). A skull was discovered in a limestone deposit at Taungs (Western Cape Colony), in 1925, by Pro-fessors Dart and Young of Witwatersrand University. In connexion with this discovery, Sir A. Keith, F.R.s., has declared that traces of human life may yet be discovered in Miscene times (see col. i. V., iii.).

Homo Heidelbergensus (The Heidelberg Man).—

A lower jaw was discovered near Maner, Heidelberg, in x907. This is held to be that of a primitive man of the Pleistocene Period.

The Pittdown Skull (Eo anthropos, or Primitive Man).—Discovered in 1912 at Piltdown, Sussex, and ascribed to primitive man of early Paleo-

lithic times

Neamderthal Man - Remains of a skull and Accordance water water commission a skull and parts of a skeleton found in 1859 in the Neanderthal Ravine, near Dusseldorf, Rhenish Prussia, and cohers found at \$191, Beignum, in 1854, are held to represent the oldest known doirchephalic (long-headed) race in Europe, living about 50,000 years before the Christian Era. In 1925 a similar skull was found near Tabgha, Palestine.

Homo Primgenus.—Discoveries of interred human remains at Combe Capelle, Dordogne, France (1900), at Brux and Brunn, Moravis, and at Galley Hill, Northfleet, Kent (1895) are held to be those of human beings of late Paleolithic times, from 35,000 to 15,000 B C STAGES OF CIVILIZATION.

The terms employed by ethnologists refer to periods, not of time, but of culture, and are of local application only, there being no universal synchronous sequence in all parts of the world. Races of Europe, Asia and America had reached the Iron Age of development long before the ath century, A.D., while laces in Oceania were still in the Paleolithic (or at least Neolithie) stage at the time of Cook's voyages.

The Stone Age.—The ancestors of primitive man are held to have adopted the use of stones of a suitable size for defence, while primitive man made such instruments more effective by sharpening them to a rough point. The earliest period is known as Eolithic (or Dawn of the Stone Age), and this Bottone (or lawn of the stone age, and this period may have extended to 600,000 yoars BC Weapons of a later period, known as Paleolithic (or Old Stone Age), show gradual developments, from the chipped, leaf-shape forms, known as Chellean (from Chelles, Seine et Marue, France). and employed, perhaps, from 400,000 to 100,000 B.C., to later and more effective flint points, arrow heads and spear-heads, flat on one side, known as Mouterian (from Le Moustier, where many such implements and other remains were

found). The Mousterian period is held to have lasted until about 20,000 B.C., when Neohthic (or New Stone Age) weapons, polished and less crudely fashloned, were brought into use for a further period of about 5,000 years. In the Stone Age the burial of the dead was influenced by the primitive nature of the implements available for digging, the graves being only large enough to contain a body huddled together in a cramped position.

Cultivation of the Soil .- Cultivation is believed to have followed the interment of the dead about 10,000 B.C., and rendered possible the political (polis = city) organisation of mankind There appears to have been a definite centre of Western Civilization at Nuppur (and elsewhere in Iraq) no later than 6,000 BC, and in Egypt, under the first of the Pharaohs (Menes), about 5,000 BC. It is not yet known if a similar degree of Eastern civilization had been reached in China, or elsewhere, during (or before) that of Iraq and Egypt.

The Bronze Age —Intercommunication of races introduced a knowledge of the malleable properties of copper, while the spread of commerce distributed tin from Savony and Cornwall among the races of Europe and Asia Implements and utensils of cast bronze superseded those of stone, wood, horn or bone The designs and decorations suggest that this stage of culture was introduced into Europe from Asia, and it must therefore be dated for the East far earlier than for the West, over a period ranging from 5,000 to 2,000 B.C. The Bronze Age appears to have been marked by the cremation of human remains, in place of mere burial in a constricted

position.

The Iron Age.—Implements of cast bronze were in turn superseded by those of hammered iron at varying dates—in China, Chaldaea, Assyria and Egypt about 4000 BC; in South-Eastern Europe about 2000 B.C., spreading over the rest of Europe from 2000 B.C. to 200 A.D., by which time the use of hammered iron was known throughout Scandinavia and in Ireland It is possible that the Eastern civilization discarded the use of bronze and adopted that of iron even before the West had reached the Bronze Age, and while the remoter parts were still in the Palacolithic Age. With the Iron Age was reintroduced interment of human remains, in place of Brouze Age cremation, but the hodies were laid at full length in the ground and not huddled up as in the Stone Age.

EPOCHS AND CALENDARS

Abyssiman - The Ethiopians have a chronological system which starts from the first day of the reign of the Roman Emperor Diocletian and proceeds in cycles of 532 years, the numeration beginning again on the completion of a cycle The first year began on 19th August, 184 A.D. (See also "Coptic," post)

Armenian.—The Armenians marked their seces-

Armenian.—The Armeniansma ked their secession from the Gleek Church by adopting it as their epoch. This corresponds to 9th July, 528 A.D.

Babyloman.—In the eighth century, B.O. the

Babylonians began a cluonology with the era of the accession of the founder of their Empire,

Nabonassar, 26th February, 747 B C
Biblical.—The Christians of Western Europe made many calculations concerning the date of the Creation of the World, based upon the genealogical tables in the Old Testament. In the genealogical tables in the Old Testament. In the seventeenth century (1650) James Ussher, Archsystems of chronology were those of the Budshers.

bishop of Armagh, published his Annales Veteris Testamenti, and Uniher's Notation was afterwards printed in marginal notes to the Authorised Version of the English Bible. Ussher's Notation placed the Creation of the World in 4004 B.C.

Christian. - In the chronological system known as the Christian, now in use, the years are dis-tinguished by cardinal numbers before or after the Incarnation, the period being denoted by the letters R.C. (Before Christ) or, more rarely, A.C. letters R.c. (Before Christ) or, more rarely, A.C. (Ante Christium.), and A.D. (Annus Domini), the conventional abbreviation A.D. signifying Anno Domini, "in the year of the Lord." The correlative dates of the epoch are the 4th year of the roath Olympiad, the 753id year from the Foundation of Rome, 376x A.M. (Jewish Chronology), and the 4714th year of the Julian Period. This was introduced into Italy in the sixth century, and though first used in France in the seventh it was not universally established there until about the eighth century. It has been said that the system was introduced into Emcland by St. Augustine (A.I. 596), but was probably not generally used until some centures later. It was ordered to be used by the Bishops at the Council of Chelsea, A.D. 816. The actual date of the birth of Christ is uncertain December 25, B.C. 4, and other dates have been cember 25, B.C. 4, and other dates have been assigned.

Coptic.-In the Coptic Calendar, which is used by part of the population of Egypt and Ethiopia, the year is made up of zamonths of 30 days each, followed, in general, by 5 complementary days Every fourth year is an Intercalary or Leap-year. and in these years there are 6 complementary days. The Intercalary year of the Coptic Calendar immediately precedes the Leap-year of the Julian Calendar. The Era is that of Diodettian or the Martyrs, the origin of which is fixed at A D. 284, August 29 (Julian date) A Coptic Calendar for the year 1648 and part of 1649 is appended :-

Hindu.-In addition to the Muhammadan neckoning there are four cras used in India. The principal astronomical system was the Kallan-a Era, which appears to have been adopted in the fourth century A.D. It began on 18 February, 1702 B.C. The chronological system of Northern India, known as the Vikrama camvat Era, prevalent in Western India, began on 23 February, 57 B.C. The year 1932 A.D. 18, therefore, the year 1938 of the Vikrama Eta. Ir Southern India, the Saka Era, with its epoch of 3 March, A.D. 78, was probably founded by Kanishka (whose sway was widely extended), and is in general use. The vent 1932 A.D. is 1853 of the Saka Era. In the Hills, the Saptarshi Era dates from the moment when the Saptarshi, or teckoning there are four cras used in India. dates from the moment when the Saptarshi, or saints, were translated and became the stars of

Year of Hegira

dhists and the Jains. The Buddhists reckoned nnist and the same. The Deathers receded from the death of Buddha in \$43 B.C. (the actual date being \$47 B.O.); and the epoch of the Jains was the death of Vardhamana, the founder of their faith, in 527 B.C.

Janual .- The Jews hold that the world was created at the time of the Autumnal Equinox in created at the time of the Austriana Equinox in the year 3766 B.C. or year 924 of the Julian Period, and the epoch or starting point of Jewish Chronology corresponds to October 7 B C. 376z. Thus the year 1932 A.D. is Annus Mundi 5692-93 in the Jewish Calendar:

(Part of A.M. 569s and A.M. 5693.)

Muhammadan.-The Muhammadan Epoch is based on the Hegira or Flight of Muhammad from Mecca to Medina. The first day of the Era is not the actual day of the Flight but is Ers is not the actual day of the Fight but is stift July, 6as A.D. This Calendar is purely lunar. The year consists of 1s months of 30 or 39 days alternately, the last being sometimes 30, and is therefore either 334 or 335 days in length, It follows that the Muhammadan year begins earlier year by year, according to Gregorian dates, by zo, zr or ze days. The year 1932 is 1350-32 of the Hegra. The dates of the begrunings of the months are shown below:—

Olympiads. - Greek chronology was reckoned in cycles of four years corresponding with the periodic Olympic Games held on the plain of Olympia, in Elis, once in four years, the in-tervening years being the first, second, &c., of the Olympiad, which received the name of the victor at the Games The first recorded Olympiad is that of Chorochus, 776 B C.

Persian.—The chronology of Persia, which is still followed by the Parsees of India, dates from the June, 63s A D The year 1931 is, therefore, 1300 of the Parsees. The New Year begins on xist March.

Roman. - Roman historians adopted as an epoch the Foundation of Rome, which is believed to have happened in the year 753 BC, and the ordinal number of the year in Roman reckoning are followed by the letters A U C (Anno Urbia Conditæ). The Calendar as we know has developed from one established by Romulus, who is said to have used a year of 304 days devided into ten months beginning with March, to which Numa added January and February, making the year lunar This became the Julian Calendar and later by a slight alteration the (hegorian (sec p. 8a) nowin general use. In the Roman (Julian) Calendar the days of the month were counted backwards from three fixed points, and an intervening day was said to be somany days before the next coming noint the first and last being counted. there points were (s) the Kalends, by which name the first of each month was known; (a) the Nones (nine days before the 1des) which fell on the seventh day of the month in March, May, July, and October, and on the fifth day in each of the other months; and (3) the Ides, which fell either on the 15th or 15th, and thus divided the month nearly equally. The Latin equivalent of Dec. 31, it for example, was Pridie Kalendas Januarias, and the day before that ante diem tertium Kalendas. CHRONOLOGICAL TERMS.

The Day, Week and Month.—Measurements of time are based on the times taken by the earth to rotate on its axis; by the moon to revolve round the earth; and by the earth to revolve round the sun. From these which are not com-mensurable, certain average or mean intervals have been adopted for ordinary use. Of these the first stile Day, which begins at midnight and is divided into a hours of 60 minutes, each of 60 seconds. The hours are counted from midnight up to ze at noon, and again from noon up to xs at midnight, except when the Twenty-four Hour reckoning is employed. The 24-hour reckoning ignores A.M. and P.M., and the hours are numbered e to an from midnight to midnight. For the Astronomical Day, see p. 77.

The Week is a period of 7 days.

The Month in the ordinary calendar is approximately the twelfth part of a year, but the lengths

of the different months vary.

The Equinoctial or Tropical Year is the time that the earth takes to revolve round the sun that the earth takes to revolve round the sun from equinox to equinox, which is 36; wazs mean days. The Calendar Year consists of 365 days, but a year the date of which is divisible by 4, without remainder, is called Leap Year and consists of 366 days. The last year of a century is not leap year unless its number is divisible by 400 (e.g. the years 1800 and 1900 had only

400 (e.g. the years 1800 and 1900 had only 365 days).

Old and New Style.—In the Julian Calendar the contennial years were all leap years, and the contennial years were all leap years, and for this reason towards the close of the sixteenth century there was a difference of re days between the tropical and calendar years (see above). In 1252 Pope Gregory ordshed that Oct. 5th should be called Oct. 15th, and that overy fourth end-century year only should be a leap year (see above). This change was adopted by Italy, France, Spain, and Portugal in 1252; by Prussia, the German Roman Catholic States, Switzerland, Holland, and Flanders on Jan. 1253, Poland 1256, Hungary 1257, the German and Netherland Protestant States and Denmark 1270e, Sweden (gradually) by the omission of and Netherland Protestant States and Denmark z700. Sweden (gradually) by the omission of eleven leap days, z700-1740, the British Dominions (which included the then North American Colonies) in z752, by the omission of eleven days (Sept. 3 being reckoned as Sept. 14) This "Gregorian" (Selendar was adopted by Japan in 1872, China in z912, Bulgaria in z913, Turkey and Swiet Russia in z92, by Yuoslavia Turkey and Soviet Russia in 1917, by Yugoslavia and Rumania in 1916, and by Greece in February, 1933. The Russian, Greek, Serbian and Rumanian Churches did not abandon the Julian Calendar until May, 1923, when the Gregorian, slightly modified, was adopted. The difference between the Old and New Styles was zz days after 2700, za days after 1800, and has been 13 days since

New Year's Day .- In England in the seventh century, and as late as the thirteenth, the year was reckoned from Christmas Day, but in the twelfth century the Anglican Church began the year on the asth March, and this practice was adopted generally in the fourteenth century. The Civil year in the British Dominions (exclusive of Scotland) began with "Lady Day" until 1751. of Sootland) began with "Lady Day" until 1751. But in and since 1752 the civil year has begun with Jan. 1. Dividends are, however, still paid by the Bank of England on the last day of Quarters according to a reckoning based on Old Style. The Income Tax year begins on April 6 in accordance with Act of Parliament (39 Geo. III. 1798).

New Year's Day has been changed in Scot-tand from Mar. 25 to Jan. 12 in 2500. On the Continent, Jan. 2 was adopted as the first day of the year by Venice in 1522, Germany in 1544, Spain, Portugal and the Roman Catholic Netherlands in 1556, Prussia, Denmark and Sweden in 1559, France 1564, Lorraine 1579, Protestant Netherlands 1583, Russia 1725, Tuscany 1751.

Golden Number.—In the year 432 B.C. Meton, an Athenian astronomer, found that and Lunations are very nearly, though not exactly, equal in duration to 19 Solar Years, and hence, considering the mean motion only, after 19 years the Phases of the Moon recur on the same days of the month. This discovery was held to be of so great importance that the dates of Full Moon in a cycle of nineteen years were inscribed in figures of gold on public monuments in Atheus. The Cycle of nineteen years is called the Metonic Lunar Cycle, and the number showing the position of a year in the Cycle is called the Golden Number of that Year.

Kaster-Day is the first Sunday after the full moon which happens upon, or next after the arts day of March; and if the full moon happens upon a Sunday, Easter-day is the Sunday after. This definition is contained in an Act of Parliament (a4 Geo. II., cap. a3), and explanation is given in the preamble to the Act that the day of Full Moon depends on certain tables that have been prepared. These are the tables whose essential points are given in the early pages of the Book of Common Prayer. The Moon of the Book of Common Frayer. The Moon referred to is not the real moon of the heavens, but a hypothetical Moon on whose "Full" the date of Easter depends, and the lunations of this "Calendar" Moon consist of twenty-nine and thirty days alternately with certain necessary modifications to make the date of its Full agree as nearly as possible with that of the Moon of the heavens. The artificial Moon is accounted to be full on the fourteenth day, i.e., thirteen days after the New Moon, in order to be consistent with an early Jewish pracorder to be consistent with an early Jewish practice, but this point is immaterial. The Full Moon of the Calendar on which Easter depends is called the Paschal Full Moon

By the above ordinance Easter falls on one of 35 days. A proposed reform that would limit it to one of 7 days has received Parliamentary support, but there is no prospect of its adoption Epact .-- The age of the calendar Moon on Jan. 1 in each year, formerly used in determining the date of Easter.

Solar Cycle.—A period of twenty-eight years, in any corresponding year of which the days of the week recur on the same days of the month.

Julian Period.-Proposed by Joseph Scaliger in rysa. The period is 7680 Julian years, and its first year coincides with the year 4713 B.C. 7680 is the product of the number of years in the Solar Cycle, the Metonic Cycle and the cycle of the Roman Indiction (28 × 19 × 15). The Julian Day, as used in astronomy, begins at noon.

Roman Induction.—A period of fifteen years, instituted for fiscal purposes about A.D. 300.

The Dominical Letter is one of the letters A-G which are used to denote the Sundays (Lord's Day) in successive years. If the first day of the Pay in successive years. A ten and any own is a year is a Sunday the letter is A; if the second, B; the third, C; and so on. Leap year requires two letters, the first for Jan. z-Feb. se, the second from March z-Dec. zr. THE Superficial Area of the Earth is estimated to be 196,550,000 square miles, of which 55,500,000 square miles are Land and 141,050,000 square miles Water. The Diameter of the Earth at the Equator is 7,926 English miles, and at the Poles 7,900 English miles. The Equatorial Circumference is 24,901'8 English miles, divided into 360 Degrees of Longitude, each of 69:17 English (or 60 Geographical) miles; these Degrees are measured from the Meridian of Greenwich, and numbered East and West of that point to meet in the Antipodes at the 180th Degree. Distance North and South of the Equator is marked by Parallels of Latitude, which proceed from zero (at the Equator) to 90° at the Poles.

AREA AND POPULATION.

Continent.	Area in Square Miles	Estimated Population.
Europe	3,750,000 17,000,000 17,500,000 8,000,000 6,800,000 3,450,000 5,000,000	475,000,000 1,013,000,000 143,000,000 146,000,000 64,000,000
	55,500,000	1,849,500,000

The British Dominious extend over the largest The MIGHT DOMINIONS SECTION OVER the largest area (14.250,000 84. miles); the Russian Union is second (9.250,000 84. miles); France is third, with 4.326,000 84 miles; the United States, with its limitar Jurisdiction, &c., covers 3,750,000 84. miles, Brazil 3,220,000 84. miles, and China 3,000,000 84. miles.

THE CONTINENTS.

Europe forms about one-fourteenth of the Europe forms about one-fourteetts of the land surface of the globe. Its longth from the North tape, 72° 28' N., and tape Matapan, in the south of Greece, 36° 23' N, is about 2,400 miles, and its breadth from Cape 8t Vincent to the trals is about 3,300 miles. The political boundary between Europe and Asia extonds some distance beyond the Urals, to include the mining regions, in the south-east it follows the valley of the Manych, north of the Caucasus.

Ama extends over nearly one-third of the land surface of the globe. The distance between its viteme longitudes, the west coast of Asia Minor (a6' E) and the East Cape (x70' W.), is 6.000 miles The extreme latitudes, Cape Chelyuskin (76° 30' N.) and Cape Buru (50 miles north of the Equator), are 5,350 miles apart Asia is bounded by the ocean on all sides except the notinged by the ocean on an sides except the west. The Isthmus of Sucz connects it with Africa. The land boundary between Europe and Asia is formed on the west mainly by the Ural November 1. In the south-west the valley of the Manych, which

o'The Earth is a polere, with a Northern and Southern Hemsuskere, the Ocean surface is the Hadrosphere, and the gaseous envelope the Atmosphere, of which the lower layers are the Traposphere and the upper the Strate-gaseous envelope the Atmosphere, of which the lower layers are the Traposphere and the upper the Strate-gaseous in Geography with the measurement of its surface as Geography, and the surface of t

stretches from the Caspian Sea to the mouth of the Don, is now taken as the line between the two continents, although the Cancasus was formerly considered as belonging to Europe. The islands of the srchipelago which lies in the south-east between the continents of Asia and Australia may be divided into two groups by a line passing east of Timor, Timor Laut, the Kei Islands and the Moluccas.

Africa is about three times the area of Europe
Its extreme longitudes are zy W. at Cape
Verde and zz E. at Cape Guardafu. The
extreme latitudes are tape Blanco in zy N. and
Cape Agulhas in zg B., at a distance of about
5,000 miles It is surrounded by seas on all sides, except in the narrow isthmus through which is cut the Suez Canal, and may be con-sidered as a great peninsula of the Eurasian continent.

North America, including Mexico, is a little less than twice the size of Europe. Its extreme, longitudes extend from a little weat or xor W to gajow W in the east of Newfoundland, and its extreme latitudes from about 80° N. lat. to rs N. lat. in the south of Mexico. It is suirounded by seas on all sides except in the south, where it joins the Isthmian States of Central America, which have an area of about soc,000 square miles The area of the West Indies is about 65,000 square miles, a little more than half that of the United Kingdom. They extend from about 27 N latitude to 20 N. latitude.

South America is a little note than 1% times the size of Europe
Cape Branco 32° W. and Punta Parma & W. and the extreme lengthides are latitudes, Punta Gallinas, 12% N. and Cape Hom 56° S. South America is surrounded by the ocean, except where it is fomed to Central America by the partow isthmus through which is cut the Panama Canal.

THE BACES OF MANKIND.+

The Races of Mankind are divisible according to Stock or, less scientifically, according to Colour The Dominant Colour is Yellow—the (3) Black, (4) Brown, (5) Red The main Divisions of the Races are as follows.—

~ -		
Division	Area	Estimated Number
	· +	r
Mongolian Caucasian Negro Semitic Malayau Red Indian,&c.	Asia Europe & Orient Africa North Africa Oceania, &c. America	680,000,000 725,000,000 210,000,000 104,500,000 30,000,000
		7,849,500,000
l	<u>.</u>	

t 15 has been estimated that the Earth can maintain a population of 6,000,000,000, a total which will be reached about A.D. 2200, at the present rate of increase

Area and Population of the World by Continents.

OCEAN AREAS AND DEPTHS.

The greatest known Ocean Depth (in the The greatest known Ocean Depth (in the Paolist, of Mindana), 32.08 feet) is not much greater than the greatest land height (in the Himalayas), but the mean depth of the Ocean floor exceeds 12.000 feet, while the mean height of the surface of the land area of the Earth above sea layed is only 2,300 feet. The following table gives the areas of the principal oceans and seas, with the greatest known death of each:

with the greatest	known dept	th of each :
Name Pacifiè	(sur rolles)	Greatest Depth (feet) Off Mindanao,
		Porto Rico Trench,
		3x,366 Sunda Trench, 22,968
	Seas.	North Polar, 13,200
Malay Central American	1,770,170	Kei Trench, 2x,342 Cambbean, 20,568

THE TARABORATAT AND

† The most famous river fulls are Nunoara, between the Province of Ontario and New York State, on the Nagara Kurer; the Vectora Fulls on the Zambest River, Sucasu between Argantin and Brasil; and the series of falls in the Posentie Valley in California.

TEMPERATURE AND

GENERAL: The maximum temperature on record of the air in shade is 234° Fahr., observed at Greenland Rauch, California, on July 10, 1913.

The wettest station in the world is generally allowed to be Cherra Poonjee in Assau, where the total fall for the year has exceeded as 1/2 inches. From June 1s to 16, 1896, 142 14 Inches was collected, or an average daily fall of 22.83 inches. On one of these days, June 14, 40.80 inches fell in 24 hours.

BRITISH ISLANDS: The maximum temperature of the air recorded in the shade at 4 feet above the ground is 100 Fahr. This was observed at Wilton House, Salisbury, on July 15, 1881, and at Greenwich Observatory on Aug. 9.

The lowest tenuerature of the air recorded

The total rainfall for a year at Stations in the British Islands during the 55 years 1890 to 1924 ranged from 246 gs inches at Llyn Llydaw (Copper Mill), Carnarvon, and 247 30 inches at the Stye, Cumberland in 1923, to 9 29 inches at Margate in 1021.

The maximum wind-velocity on record in the British Isles was recorded at Scilly on December 6, 1929, when a gust reached the rate of xxx miles per hour.

The League of Mations.

THE League of Nations came into being when the Treaty of Peace with Germany was ratified on January 10, 1920. Its Charter, containing a6 Articles, is known as the Covenani, which begins

with the following words :-

"The High Contracting Parties, in order to promote international co-operation and to achieve international peace and security by the acceptance of obligations not to resort to war, by the prescription of open, just and honourable relations between nations, by the firm establishment of the understanding of international law as the actual rule of conduct among Governments, and by the maintenance of justice and a scrupulous respect for all treaty obligations in the dealings of organised peoples with one another, agree to this Covenant of the League of Nations"

The Covenant of the Learne contains fundamental clauses on the prevention and settlement of disputes. These clauses bind nations who are members of the League not to employ force for the settlement of a dispute until they have first submitted it to the League of Nations (or to subitrators or to judges) The right to re-sort to was was hitherto retained in case the League, or the arbitrators, failed to reach an unanimous decision, but even so, only after a delay of three months after such failure.

The Membership of the League comprises at present 54 nations, or three-quarters of the whole World, the British Empire and the Dominions (including the Irish Free State, together with India) being each an independent member, with separate voting power and representation. The only two great countries which hold aloof are America and Russia, and they, particularly America, are co-operating with the League in

a number of beneficent activities.

ORGANISATION OF THE LEAGUE.

The Assembly meets annually at Geneva about September 10, and consists of 3 representatives from every Member State, each State having

The Council meets three times a year. Great Prince, Inects three times a year. Great Britain, France, Italy, Germany and Japan are permanent members, and at present 9 other States are annually elected as temporary members. These are Poland, Yugoslawia, Peru, Spain, Venezuela, Persia, Guatemala, Norway and the Irish Free State

The Secretariat is the permanent Civil Service of the League, at Geneva, and is composed of nationals of nearly all Member States

Secretary-General, Hon Sir Eric Drummond,

K C.M.G., C.B. (British). Deputy Secretary-General, J. Avenol (French) Under Secretaries-General, Marquis Paulucci di Calboli (Italian), M Dufour Feronce (German),

M. Y. Sugimura (Japanese)

Information Section, Pierre Comett (French), Director; Arthur Sweetzer (American), Assis-

tant Director.

The Technical Organizations and Commissions, which act as expert advisers to the Council and Assembly, are continually handling questions concerning International Communication and Transit, Economics and Finance, Health, Mandates, and the Reduction of Armaments. No week passes without these bodies discussing international questions of wide interest, or without some conference being held at Genera and

achieving constructive work in international

co-operation.

The Permanent Court of International Justice, consisting of fifteen Judges and four Deputy Judges, chosen for their high legal and moral authority, sits at the Hague and deals by means of opinions and judgments with all disputes referred to it regarding International Law, breaches of International obligations, and the interpretation of treaties. It has already dealt with 35 disputes, some of which might have led to an open breach between the States concerned. It has already won a great reputation both in the Foreign Offices and in the legal professions of the world. The annual session begins on June 15; but in future the Court is likely to sit all the vear round

The International Labour Office is closely connected with the League, but has a parallel organisation of its own at Gene a, which was also set up by the Peace Treaty. The Governing who set up by the reace treaty. The Governing body represents twelve States, of which eight (in-cluding Great Britain, Canada and India) are chosen as being of chief industrial importance in the world They are assisted by an international Secretariat, which collects and disseminates information and organises conferences The conferences, to which Governments, Employers' and Workers' Organisations send delegates, pass Conventions or Recommendations which Governments ratify if they so desire. There have already been over 400 ratifications of Labour Conventions. The main object in view is to bring up the standard of labour in the less advanced States to the level of the standard in countries where greater progress has been made. The Director of the International Labour Office is Albert Thomas (French), the Deputy-Director H. B. Butlet (Bittah). There is a London office H. B. Butlet (British). That zz Victoria Street, S.W.z

Cost - The cost of the League, 1930-1, will be about £1.250,000, to which Great Britain con-

tributes some £ 120,000.

WHAT THE LEAGUE HAS DONE.

The work of the League is many-sided, and is constantly growing. It includes the prevention of a number of wars, the creation of the Permanent Court at the Hague as an alternative for war, positive reconstruction as in the case of the war, positive reconstruction as in one case of one financial i sestoration of Austria, Hungary, and Northern Greece, the outlining of an important new policy of "freer" trade, improvements in international traffic and health, progress in real control of the traffic in drugs and in women, and child welfare. After ten years continuous study of the problem of the Reduction of Armaments the League has reduced it to three bedrock principles—Arbitration, Security and Disarnament The purely technical study of Disarnament is now sufficiently advanced for the first general World Conference to be held, it is hoped, before the Twelfth Assembly meets in

Sept 1931.

LEAGUE OF NATIONS UNION.

LEAGUE OF NATIONS UNION, 15, Grosvenor Crescent, S.W. 1.*—Joint Presidents, Viscount Crescent, S.W. 1.*—Joint Presidents, Viscount Cecil of Grey of Fallodon, K.G., and Viscount Cecil of Chelwood, K.C.; Chairman of Executive Com-mittee. Prof. Gilbert Murray, LLD.; General Sec., J. C. Maxwell Garnett, C.B.E., Sc.D.

Any information about the League and its work can be obtained by application at this address.

GEORGE V	The House of Windsor. Surviving son of Edward VII	1010	WHOM GO	D PRI	ESKRVI

The House of Windsor is in direct descent from (inter alion) Ecgbert, King of Wessex, Alfred the Great and Wilham the Conqueror, also from the Emperor Charlemagne (b. 742, d. 814), Rodingo the Cid (b. 1030, d. 1099), the Emperor Barbarossa (b. 1113, d. 1129) and St. Lonis, King of France (b. 1215, d. 1270).

WELSH SOVEREIGNS AND PRINCES.

Wales was ruled by Sovereign Princes from the "calliest times" until the death of Llewellyn in 1282. The first English Prince of Wales was the son of Edward I, and was bonn in Carnarvon town on April 25, 1284. According to a discredited legend, he was presented to the Welsh chieftams as their Prince, in fulfilment of a promise that they should have a Prince who "could not speak a word of English" and should be native born. This son, who afterwards became Edward II, was created "Prince of Wales and Earl of Chester" at the famous Lincoln Parliament on February 7, 1201. The present Prince was installed in Carnarvon Castle on July 13, 1911.

GEORGE III. was the eldest son of Frederick. Prince of Wales (eldest son of George II.), and of Princess Augusta (youngest daughter of Frederick II., Duke of Saxe-Gotha Altenburg). His Majesty was born at Norfolk House, St. James's Square, June 4, 1738; Altenorg). The majesty was own at North Rouse, 5t. James 8 Square, June 4, 1735; succeeded to the Throne Oct. 25, 1760; married Princess Challotte (daughter of Charles, Duke of Mecklenberg-Strelitz); and was crowned with her on Sept. 22, 1761. (6) The Prince John.

 H.R.H. PRINCE JOHN, born July 18, 1905, died Jan. 18, 1919.

ORDER OF SUCCESSION TO THE THRONE.

The sons of the Sovereign are in the order of succession to the throne, and after the youngest son the daughters, in the order of their own seniority Thus after the Prince of Wales and the Duke of York would come the Princess Elizabeth and the Princess Margaret, daughters of the Duke of York, the Duke of Gloucester and the Prince George; then Princess Mary and her children; then, as His Majesty has no brothen, his sisters, with the children of the eldest in preference to the second sister; then the second daughter of the late Duke of Saxe-Coburg (his eldest daughter, Queen Marie of Rumania, having formally renounced on her marriage all possibility of claim to the British Throne). After traversing the Saxe-Coburg branch, we treat similarly those of Connaught and Albany. Having thus exhausted the families of all Queen Victoria's sons we turn to her daughters, beginning with the house of the late Empress Frederick; but as this line, with the ex-German Emperor at its head, is wholly out of practical lounds, it would be profitless to pursue the investigation any further.

ANNUITIES TO THE ROYAL FAMILY.

The annuities payable to Their Majestics and to the members of the Royal Family are known as the Civil Luxt, which is granted by Parliament upon the recommendation of a Select Committee. The Civil List of King Edward VII. amounted to £470,000, in addition to which annuities to other members of the Royal Family accounted for an additional annual sum of £100,000. The Select Committee appointed on June 14, 1920, reported on July 7, and made recommendations, which were adopted by the House of Commons. These recommendations, as modified by subsequent events, are also subject to the voluntary deductions announced by H.M. the King.

Peeresses in Their Gwn Riaht.

PRERESSES IN OWN RIGHT.—Peerages are occasionally granted immediately to ladies of distinction or the widows of distinguished men; but frequently the instances falling under this heading are the result of regular inheritance in lines which are open to females in default of males. Thus the results that some of the Peeresses now upon the list have male heirs who will succeed them in the ensuing generation and take their seats by strict right in the House of Lords; while, on the other hand, several peerages now occupied by males will fall to the other se, and thus for a time take leave of that House. A resolution to admit Peeresses in their Own Right to the House of take leave of that house. A resolution to admit Peeresses in their Own Right to the House of Lords was defeated in that house in 1939. A Peeress in her own Right ratins her title after marriage, and if her husband's rank is the superior she is designated by the two titles jointly, the inferior one last; her hereditary claim still holds good in spite of any marriage whether higher or lower. No rank held by a woman can confer any title or even precedence upon her husband; but the rank of a Peeress in her own right is inherited by her eldest son (or perhaps daughter), to whomsoever she may have been married.

Courtesp Titles borne by Eldest Sons (in actual use in 1932).

Holders of Courtesy Titles are addressed in the manner shown for holders of substantive titles

From this list it will be seen that the "Marquess of Blandford" is the heir to the Dukedom of Marlborough; that the "Earl of Altamont" is the eldest son of the Marquess of Sligo, while "Viscount Acheson" is heir to the Earldom of Gosford, and "Lord Aberdour" to the Earldom of "Viscount Acrosson where to the maridom of costory, one "Lord Abertonic of the Emiliation," deletes son of the "Marquess of Hartington," her to the Dukedom of Devonshire, "Viscount Baylam," eddes son of the "Barl of Brecknock," here to the Camden Marquessate, and "Viscount Savernake," eddes son of the "Earl of Cardigan," here to the Marquessate of Allesbury.

NOTE .- In titles marked o the " of" is not used.

Wodehouse-Kumberley In addition to the above Titles of Courtesy the eldest son of Scottish Viscounts and Baions is by styled "The Master of ——" e.g. "The Master of Falkland," eldest son of Viscount and; "The Master of Carnegie," eldest son of Lord Carnegie and grandson of the Earl of

—A neaster

Contractions used in pages 111-129.

Contractions.—S. or I. appended to the date of creation denotes a Scottush or Irish title; the further addition of a * implies that the Peer in question holds also an Imperial title, which is apecified (after the usure) by its more definite description as Engl., Brit. or U K. When both titles are alike, as in the case of Argyll, this star is appended to the conjoined date below, and it then denotes that such date is that of the Imperial creation. A † appended to S. or I. implies that the Peer is an elected Representative to the House of Lords. For the mark 'see heading to Marquesses; b. signifies born; s., succeeded; m., married; w., widower or widow; M., minor.

THE GRAND PRIORY IN THE BRITISH REALM OF THE VENERABLE ORDER OF

THE HOSPITAL OF ST. JOHN OF JERUSALEM. (INCORPORATED BY ROYAL CHARTER)

THE Order had its origin in Jerusalem as an International lay confraterity for the relief of Christian pilgrims to the Holy Land, and was later sovereign in Rhodes and Malta, where its Christian pilgrims to the Holy Land, and was later sovereign in Rhodes and Malta, where its Knights kept galleys and galleons to attack the Bailary Corasirs and to prevent the spread of Turkish rule in the Mediterranean, from 1530 to 1708. The objects and purposes of the Order are, amongst other things, the maintenance of the 8t. John Ophthalme (hepstal at Jeunalem, and the 8t. John Ambulance Association and Brigade at Home and Overseas, and the London Light and Electrical Clinic for poor people. The Order is conferred for services in the cause of humanity throughout the Empile, and is open to both men and women. There are 5 classes: Balliffs and Dames Grand Cross. Knights and Dames of Justice and of Grace; Commanders of both seves; (Serving Brothers and Suster These distinctions are notified in the London Gazette, but do not confer any rank or title. The ribbon of the decorations of the Owley is block (watered). Haddungsters, 8t. John; Gate, Clerkenwell, E.C.; 1. Order is black (watered). Headquarters St. John's Gate, Clerkenwell, E.C.1.

Younger Sons of Knights in the same order as their Fathers. Naval, Military, and other Esquires by Office.

by Omec.

Women take the same rank as their husbands or as their iddest brothers; but the daughter of a Peermarrying a Commoner retains her title as Lady or Honourable. Baughters of Feers rank next immediately after the wives of their older brothers, each before their younger brothers wives Daughters of Peers marrying Peers of lower degree take the same order of precedency as that of their husbands; thus the daughter of a Duke marrying a Baron degrades to the rank of Baroness only, while her sisters married to commoners retain their rank and take precedence of the Baroness Aerely official rank on the husband's part does not give any similar presedence to the wife.

For Dames Grand Cross and Dames Commanders of the Bridge Empire, see p 158.

Sec. 12

LOCAL PRECEDENCY. — No written code of county or city order of precedence has been promulgated, but naturally in the county the Lord Lieutenant stands, first, and secondly the Sheriff. In London and other Corporations, the Mayor stands first, after him the Aktermen, Sheriffs, Chief Officers, and Livery. At Ogford and Cambridge the High Sheriff takes precedence of the Vice-Chancellor.

For fuller tables (and for Scottish and Irish Pressioney) see Introduction to "Whitaren's Presser, Baronetaus, Khiqutage and Companionaus," a companion rotume, price sed not.

A complete list, in dipalectical Couler (the only list so published), of all holders of these decorations will be found in "Whitaren's Presser.

THE ORDER OF MERIT (1902)-O.M. Ribbon, Blue and Crimson.

This Order confers no precedence. It is designed as a special distinction for enument men and women—without conferring a knighthood upon them. The Order is limited in numbers to a4, with the addition of foreign honorary memlers. Membership is of two kinds, Military and Civil, the badge of the former having crossed swords, and the latter oak leaves. Membership is designated by the suffix o M, which is authorised to follow the first class of the Order of the Bath and to precede the Letters designating membership of the inferior classes of the Bath and all classes of the remaining Orders of Knighthood.

THE KNIGHTS BACHELOR.

The Knights Bashelor do not constitute a Royal Order, but comprise the surviving representation of the ancient State Orders of Knighthood. The Register of Knights Bashelor, instituted by James I in the systic cantury, lapsed, and in 1908 a voluntary association under the title of "The Society of Knights" (now "The Imperial Society of Knights accounts of the Command) was formed with the primary objects of continuing the various registers dating from 1893 and obtaining the uniform registration of very greated Knight. In 1908 a design for a badge to be worn by Knights Bachelor was approved and adopted, a ministure reproduction being shown at the head of this paragraph. An annual Knightage is published from information supplied by the authorities, and can be obtained on application. The Officers of the Society are :—Principal, Vice-Principal, Commander Sir Trovo Dawson, Br., R.; Hegistery, Sir Park Goff, M.P.; Clerk, Hubert Whelbourn; Registry and Library, as Old Buildings, Lincoln's Inn, W.C. s

Mames Grand Cross and Dames Commanders of the Graek of the British Empire.

Note.—Dames Grand Cross (G.B.E.) and Dames Commanders (D.B.E.) are addressed in a manner similar to that of Knights Grand Cross or Knights Commanders, e.g. "Miss Florence Smith." after receiving the honour of G. (or D.) B.E. would be addressed as "Dame Florence," and in writing, as "Dame Florence Smith, G. (or D.) B.E." Where such award is made to a lady already in enjoyment of a higher title the appropriate letters are appended to her name, c.g. "The Countess of _____, G.B.E." Dames Grand Cross of the British Empire rank after wives of Baronets and before wives of Knights Grand Cross. Dames Commanders rank after the wives of Knights Grand Cross and before the wives of Knights Commanders.

DAMES GRAND CROSS AND DAMES COMMANDERS.

THE VICTORIA CROSS. F'E.

Ribbon, Crimson for all Services.

The Victoria Cross was instituted in 1836, on the close of the Crimean War, and extended in 1831 and 1830. The decoration is worn before all others, on the left breast, and consists of a bronze Maltese Cross, 134 inches in diameter, with the Royal Crown surmounted by a lion in the centre, and beneath there is the inscription "For Valour." A special annuity of \$\frac{1}{2}\$ a year is granted to every recipient below Commissioned Rank, with an additional \$\frac{1}{2}\$ a year for every bar, such bar being added for additional acts of bravery which would have entitled the recipient to the Victoria Cross if he or she had not already received it. In the event of an annuitant being unable to obtain a livelihood on leaving the Service, the amount of the annuity may he increased to \$\frac{1}{2}\$. In \$\text{psz}\$, the right to receive the Cross was extended to Indian soldiers, and in \$\text{psa}\$ a Royal Warrant extended the right to Matrons, Sisters and Nurses, and the Staff of the Nursing Services and other services pertaining to Hospitals and Nursing, and to Civilians of either sex regularly or temporarily under the orders, direction or supervision of the Naval, Military or Air Forces of the Empire.

A LIST OF SURVIVING RECIPIENTS.

Parliamentary Summary, Lords and Commons, 1930-31. 171

THE KING'S SPEECH .- For the first time since his illness, the King opened the new Session on Oct. 28, and read his Speech in firm, clear tones in the presence of the Queen, the Prince of Wales and a brilliant gathering. He referred with sympathy to the continuance of heavy unemployment, and said that the Government would persist in its efforts to develop and extend home, imperial and foreign trade and to help in measures that would lead to greater efficiency in industry. Proposals would be made for the promotion of increased settlement and employment on the land and of large-scale farming operations, for the acquisition and improvement of agricultural land in need of re-conditioning. and for the organisation of producers for marketing purposes. A Commission would be set up immediately to enquire into the whole question of unemployment insurance and the allegations of abuse of its provisions, further financial provision for the Unemployment Fund being meanwhile made. Legislation to secure for the community its share in the site value of land and a measure of electoral reform would be introduced, and measures would be submitted for raising the age of compulsory school attendance, amending the law relating to trade disputes and trade unions, and setting up a Consumers' Council. Other legislation promised in the Speech related to the extension of the law concerning town planning, the amendment of the Factory Acts and the establishment of a new statutory authority to deal with passenger traffic in London. In the Lords, the Address in reply was moved by Lord Sanderson, a blind peer, and seconded by Lord Marks, and was agreed to. In the Commons, after Mr. Charleton had moved and Mr. W. Taylor had seconded the Address, the Prime Minister informed Mr. Baldwin that the Royal Commission on Unemployment Insurance was necessary to keep recom-mendations for the reform of the system free from party taint, and declared that the removal of the Trade Disputes Act would mcrease the chances of industrial peace and end a piece of prejudiced legislation. The first amendment, noved by Mi. Jowett on Oct. 32, called for Socialist reorganisation of industry, agriculture, banking and the import and export trades and for the fairer distribution of the national income It was rejected by 156 to 11. Mr. Neville Chamberlain on Nor. 3, moved the official Opposition amendment, which expressed regret at the failure of the Government to propose any measures adequate to deal with the crisis in the industrial, agricultural and commercial situation or to check the continued growth of unemployment. Mr. MacDonald on the following day said ment. Air. MacDonaid on the ronowing day such that the rise in unemployment was inevitable, whatever dovernment had been in power. They were encouraging the re-organisation of one industry after another, and would not be hild up indefinitely by the refusal of any industry to cut out dead wood. The amendment was deaded by the additional wood. feated by sar to sgo, and the Address was agreed to.

the sympathetic industrial strike should not be illegal. No one should be charged with intimidation, and a corporate body should have control of its funds. The Bill also sought to prevent individual convictions before an authoritative pronouncement upon the legality of a strike, and declared that the minority of a trade strike, and declared that the minority of a trade union must follow the majority in questions concerning the use of funds. Outlining the Liberal policy, Mr. Norman Birkett said they considered that the Bill would make a repetition of the general strike perfectly legal. They held that contracting in had justified itself, and they would insist on maintaining it. During the final stages of the debate on Jan 28, Sir Stafford final stages of the debate on Jan as, an amount of ripps, the Solicitor-General, declared that under the law as it existed before the Act of 1927, the general strike of 1926 would have been legal because one of its motives had been mutustrial, but that under the new Bill the general strike would have been idegal, because he was sure that the Courts would have found that the primary object was not industrial. The second reading was carried by 277 to 250, and the Bill was sent to a standing committee, where the treatment it received resulted in its abandonment by the Government. Sir William Jowitt explained early, on Feb. 12, that the Government intended to restore to the trade unions the full liberty of action which they possessed in 1926 so long as a sympathetic stike was industrial. Dr. Burgin on Feb. 24 moved an official Liberal amendment to introduce words to make illegal any strike or lock-out of which the effect was to expose the community, or any substantial part of the community, to danger to health or safety by interfering with the supplies or distribution of essential food, water, fuel, light, medical or sanitary services or other necessities of life. The amendment was described by supporters of the Government as a wrecking amendment, but it was carried by 37 to 32 on Feb. 26. When the committee to 37 on Feb. 36. When the committee met again on March 3, the Attorney-General announced that the Government would not proceed with the Bill as a consequence of this change, and said that its effect would be to put the umons in a more difficult position than they had been in at any time during the last fifty venre.

THE BUDGET.—Still suffering from the effects of a rather serious illness, Mr. Snowden introduced his Budget on Appl 27, the main feature being a promise of duties on land values when the necessary valuation had been completed The Chancellor estimated a sotal revenue of £765,000,000 and a total expenditure of £803,365,000, leaving a gap to be bridged on £37,365,000. He proposed to take powers to enable present holders of Savings Certificates enable present noncers of savings certareases due for repayment in 1938 or 1933 to extend their investment. Mr. Snowden emphasized that his task of covering the estimated deficit was exceptionally hard owing to the great depression in trude. He rejected the idea of a revenue tariff, which he described as a means of THE TRADE DISPOTER ACC.—One of the most reviewing the well-to-do at the expense of the important measures submitted by the Government was the Trade Disputes and Trade Unions tion of wages. His problem was largely a tem-damendment) Hill, and its abandonment was parray one, the declared. A reyival of trade, due to Liberal criticism. Moving the second reading on Jan 28, 3ir William Jowitt said that significant of the second significant second significant second significant second significant second significant second significant second significant second significant second significant second significant second s than our generation has ever known," he felt justified in seeking relief by means of non-recurrent revenues and temporary expedient. There were two resources to which he could turn. He felt that the Exchange Account of £33,000,000 set up to purchase foreign exchange to finance payments of our obligations abroad could be reduced by £20,000,000, largely because of the establishment of the Bank of International Settlement. The other source was obtained by partially withdrawing a concession in regard to income tax. The yield would suffer from the fall in profits due to trade depression, and he decided not to propose any increase in the standard rate. He proposed instead that the practice of paying two equal instalments of tax under Schedules B. D., and E, should be altered, so that three quarters should be paid on Jan. 1. and the remaining quarter on July z. The result would be that the Exchequer would get in an extra quarter of the year's tax within the present financial year, and the following year's yield would not be affected. These two sources, he considered, would reduce the estimated deficit by £30,000,000, and he proposed to obtain the remaining sum by adding twopence to the duty on oil, making it sixpence, instead of four-pence. The balance sheet for the current year would therefore be-revenue £803,500,000 year would therefore be—revenue £803,500,000, expenditure £803,360,000, leaving a nonlinal margin of £134,000. "If we can effect substantial economies during the year," Mr. Snowden and, "and if there is some improvement in trade, I do not think next year's Budget need be unduly alarming, but falling this, next year a heavy increase of taxation will be inevitable." Then the Chancellor came to the highly controversial part of his sneech He intanded he versial part of his speech. He intended, he said, to include in the Finance Bill provision for the taxation of land values, provision for the necessary and preliminary step of valua-tion, and provision for the imposition of a tax on land values upon the valuation thus obtained. The impost would not become operative during the current year, but he hoped that the valuation would be completed within two years from the passing of the Finance Bill, The tax would be at the rate of one penny in the pound on capital land value. The Chancellor declared that he was convinced that the proposals which would be submitted would the propossis which would be submitted would be supported by the great majority of the House and the country. "The scandal of private appropriation of land values created by the enterprise and industry of the people and by the expenditure of public money has been tolerated far too long," he contended. The present system stood in the way of social and commic progress. If inflicted crushing hurdens on industry and inflicted crushing burdens on industry and hindered municipal development. He prophecied that they would look back upon that Budget as a landmark on the road of social and economic a landmark on the road of social and economic progress, and as one further stage towards the emancipation of the people from the tyranny and the injustice of private land monopoly. Presenting the Opposition case on the following day, Mr. Neville Chamberlain said that the anticlation of the income tax would be a serious hardahip on the victims. This was the last Free Trade Budget, he declared, and no sham optimist could disguise its revelation of the

the established practice provision might be made in the Finance Bill for giving effect to any resolution for imposing a tax on laud values, although the tax was not to come into operation until a subsequent financial year. He explained that as soon as the Bill was passed the work of valuation could begin, and it was hoped it would be completed before the tax came into operation two years hence. Mr. Snowden, on May 4, moved that there should be charged for the financial year ending March 31, 1933, and for every subsequent financial year, a tax at the rate of one penny for each pound of the land value of every unit of land in Great Britain. He said that between zo,000,000 and Britain. He said that between 10,000,000 and 122,000,000 hereditaments would have to be valued by a vast staff who could not begin the work until October. Bevenue could not be received until 1933, but meanwhile the threat of the tax would cheapen land at once. He put the cost of valuation at £1,500,000. Agricultural cost of valuation at £1,500,000. Agricultural land would be exempt as long as it had a cultivation value. This meant that land used for allotments or market gardens would only be taxed on the difference between its value for cultivation and its value for other purposes. The basis of valuation was to assume that the land was here of buildings and works, and that the surrounding land was as it actually was. Then the valuer would estimate how much a willing purchaser would give a willing seller for the land, and upon that figure the tax would be levied. Those who owned land valued at less than £120 a year would be exempt, almost all working-class houses being thus exempt. The resolution was carried by all to ago on Man 6, and the report stage was passed on the follow-ing day after the rejection of a Conservative amendment to make it clear that improve-ments in site value, due to the enterprise of the ments in site value, due to the enterprise of the owner or his predecessors in title, should be excluded from the tax. The Finance Bill received its second reading on May 19, Mr. Neville Chamberlain's motion for rejection being defeated by 290 to 290, and the committee stage opened under a guillotine arrangement on June 3. The Opposition strongly contested the land tax, which the Solicitor-General estimated would require an extra staff of only a contest. mated would require an extra staff of only 2,000. One amendment to deduct the cultivation value of urban land from the site value assessed to tax instead of deducting only in the case of agricultural land was carried on June 15 on a snap division, by 232 to 265, the Prime Minister afterwards declaring that it was a purely drafting matter. The future of the Bill —and of the Government—was imperilled for some time by a Liberal threat to withdraw their some time by a liberal threat to withdraw their support unless the question of double taxation were dealt with. After negotiations, Mr. Snowden on June 2 moved an amendment to meet the objections. It provided that the land value of every land unit should be reduced either by a sum equal to four times the annual value for purposes of income tax or by a sum equal to seveneighths of the land value of the unit. During the report stage, the Chancellor on July a, moved an amendment to exempt from the tax land used as a playing field under some agreement which could not be determined for at least five years, or if it were probable that the land would continue to be so used importance of an out-worn fiscal system. A new that the land would continue to be so used procedure was required for the land values for one year or more. This was carried, as proposals, and, on April 30, on the Chancellor's was another Government amendment changing motion, the House agreed that notwithstanding

Jan. 1, 1932, and fixing the second valuation date at Aug. 2, 1936. The third reading was carried on July 3, after the defeat by 274 to 222 of an amendment for rejection. The House of Lords quickly passed the Bill, which received the Speaker's certificate that it was a money bill and could not therefore be amended by the Peers, and the Royal Assent was given on July 31, when Parliament adjourned.

ELECTORAL REPORM.—The introduction of the principle of the alternative vote and the abolition of university representation were the main features of the Electoral Reform Bill, which was read a second time in the House of Commons, by age to age on Feb. 3, after a two days' debate. The Home Secretary, explaining the proposals, said that the Government in bringing the Bill forward were fulfilling a moral duty and not signing a pact with the Liberals. The Bill, although it fell short of what the Labour Party would like, would effect a real, far-reaching improvement in our electoral system. The Labour Party regarded the aboliton of the system of plural voting as essential, while the alternative vote had the advantages and convenience of the second ballot without the latter's inconvenence and trouble, and prevented the election of a candidate against the wishes of a constituency. The Bill proposed to divide the existing double-membered constituencies into two, each of which would return a single member, schemes for the division being prepared by commissioners and laid before Parliament. The business premises qualification, except in the City of London, and Universities constituencies would be abolished, votors in the City being prohibited from voting elsewhere. The Bill also provided that motor-cars and other vehicles could not be used at elections unless registered with the returning officer. Sir Samuel Hoare described the Bill as a Socialist bid for Liberal support for a majority until 1934. For the Committee stage a time table was adopted, and when it opened on March 4, the Government accepted an amendment delaying the operation of the alternative vote system until the dissolution of the present Parliament. The Government were defeated on March 16 by 246 to aga, on the clause abolishing University representation, which was deleted. The committee stage was completed on May 12, and the third reading was secured on June 2 by 278 to 188. In the Upper Chamber the second reading was agreed to by so to 14 on June 16, but the Peers made a number of important changes in committee. An amendment to limit the operation of the alternative vote to London boroughs, other than the City and boroughs elsewhere with so population exceeding so, oco, was carried by so to so on July s, and on July 9 the Lords deleted the clauses dealing with the business premises qualification, plural voting, and the use of motor cars. These were restored by the Commons on July 16 when other amendments by the Upper Chamber were disagreed with, but no further progress was made with the Bill.

UNEMPLOYMENT INSURANCE.—Several Bills amending the unemployment insurance system were brought forward by the Government, pending the report of the Royal Commission to inquire into the question. The first Bill, which received the Royal Assent on Dec. 19, was necessitated by the fact that the debt of the

Unemployment Insurance Fund was approaching the borrowing limit of \$50,000,000, which, it was explained, would be reached by Christmas, and which was accordingly increased to \$70,000,000. Mr. Lawson said that the deficiency in the Fund was due to the increase in unemployment. At the same time a Bill was passed to retain in insurance a number of persons who would otherwise have fellen out of insurance within the wise have fallen out of insurance within the succeeding few months. Later another Bill was placed on the Statute Book, raising the borrowing limit of the fund to £00,000,000 and extending the transitional period by six months. Then on June 22, a money resolution was passed which sanctioned yet a further increase of the Fund to £x15,000,000. Miss Bondfield, justifying the Government's policy, declared that to increase contributions and decrease benefits would mean greater exactions from industries already heavily depressed and a lowering of the standard of living of the unemployed. The Bill based on the resolution received a second reading on June as fater the defeat by say to use of a untion for rejection, and the Royal Assent was given on July 8. Kinally, a Bill dealing with some of the anomalies pointed out by the Royal Commission was passed by the time Parliament adjourned. It imposed a test on habitual part-time workers as to whether they intended to work a full week or not, and laid it down that benefit should not be a dowry to give a married woman independence but to relieve an unemployed married woman still habitually employed. The Bill also set up an advisory committee to submit draft regulations to the Minister of Labour with a view to removing anomalies. An amendment for the rejection of the Bill, moved by Mr. Maxton, was defeated by 331 to 19 during the second reading stage on July 8.

HELP FOR AGRICULTURE.—Among the measures passed before the adjournment were two designed to assist agriculture. The first was the Agricultural Land (Utilisation) Bill, which set up an Agricultural Land Corporation with power to acquire land by agreement with the owners for large scale farming experiments. Explaining the proposals when he moved the second reading on Nor 13, Dr. Addison said that they were intended to increase employment and to develop a system which would make good dilapidation. Demonstration farms, which must be self-supporting, were to be established. Where it was shown that land had been seriously neglected, and continued to be neglected, there would be powers to tach it to be consultated to the provision of allotments, where there was a specially large number of men unemployed. The second reading was carried on Nov. 18 by 187 to 187, and 181 reached the Upper Chamber, it was dealt with severely. The Bill was given a second reading on Neb. 29 on the advice of Lord Hailsham. In committee, the clause providing for the establishment of a Land Corporation was deleted on April 28, and other clauses were struck out before the Bill was read a third time on May 21. The Commons disagreed with the amendments and restored the deleted clauses, but the Lords insisted on the omission of the clause dealing with large scale farming experiments, and the Bill was given the Royal Assent in this form on July 21. The second measure, the Agricultural Turk 221. The second measure, the Agricultural Turk 221. The second measure, the Agricultural Turk 221.

Marketing Bill, was outlined on Reb. 9 by Dr. Addison, who estimated that better marketing would add £100,000,000 year to the £35,000,000 obtained by British producers. The National Mark Campaign had shown that a demand existed for marketing with the British producers. for properly graded British produce, and the Bill would give and consolidate a great new market by setting up an organisation for stan-dardised produce. Its success would depend upon the loyal co-operation of producers. An element of compulsion was necessary, but ex-emptions would be allowed in some cases, such se where producers consumed their own goods or had a regular private clientele, provided that there was no under-selling. He hoped that they might capture the London egg market, remedy the disorganisation of the milk trade by providing for the use of milk surplus to local consumption, and promote alliances between kindred trades. The second reading was agreed to by 248 to 212. In committee, a Conservative amondment to prevent under-cutting from outside prescribed areas was carried. The Lords made but slight appendments and those were accepted, the Royal Assent being given on July az.

SUNDAY ENTERTAINMENTS.—As a result of the ruling by the Courts that Sunday cinema performances were illegal under a century-old performances were lilegal under a century-old statute, the Government introduced a Bill to regulate gunday performances, leaving members to vote as they wished. Mr. Clynes, moving the second reading on April xe, explained that the law of 1780, which governed Sunday performances, must either be amended or enforced. The Bill would give local authorities discretion as to which view should prevail in their areas, subject only to a guarantee that recreational facilities would produce revenue for charities and would not involve a seven-day week for any worker, and to proof being forthcoming of a substantial demand for such facilities in any area. Mr. Ian Macpherson moved the rejection of the Bill, which, he said, legalised illegality and commercialised Sunday It would, he de-clared, benefit Hollywood at the expense of Stratford-on-Avon Mr. Chamberlam pointed out that the Bill would only sanction, and not out that the Bin would only sanction, and not compel, a practice prevalent during the last twenty years, and Sn John Simon reminded members that in 1950 the House mposed on the people what it thought good for them to believe, while in 1931, Parliament gave people the right to believe what they thought good. Samming up the case against the Bill, Sin Thomas Inskip said that it might force asso, coopeople to work on Sunday in London. The account reading was agreed to work as and second reading was agreed to by \$18 to zee, and the Bill was sent to a standing committee, but was subsequently abandoned, and a temporary measure was passed legalising, but not aftering, the practice existing before the ruling of the Courts.

THE NATIONAL GOVERNMENT.

LABOUR RESIGNS .- A sudden crisis arose within a few weeks of the adjournment as a result of the state of the country's finances. The Cabinet met daily but failed to agree upon methods of balancing the nation's Budget, and

Sept. 8, when both Houses received a message from the King intimating that the condition of the national tanances called for the imposition of additional taxation, and for economies in public expenditure. In the Lords, the Marquis of Reading and in the Commons the Prime of Reading, and in the Commons the Prime Minister, explained the situation. Mr. Mac-Donald said that by the third week in August temporary credits which had been arranged were practically exhausted. The position they had to face was something like a typhoon. He denied that bankers had ever interfered with political proposals, and said that if the country was to get a loan it had to balance the Budget and put its unemployment finance on a sound basis. Mr. Henderson, who had become Leader of the Opposition, said that he had agreed that the Budget must be balanced, but he could not accept the cuts in the unemployment benefit. The division on a formal motion was treated as a vote of confidence, and the Government secured a majority of 50.

THE BLDGET BALANCED.—By the emergency Budget, opened by M1. Snowden on Sept 10, the finances of the nation were balanced and a prospective deficit of £170,000,000 was cleared—"an achievement which no country in the world has achievement which no country in the world has ever attempted," in the world of the Chancellon Nationally, he said, we had for some time been living beyond our means. The Unemployment Insurance Fund was costing the Exchequer about £ 100,000,000 this year, and the Government had decided that borrowing for that Fund and the Road Fund must cease. Based on the existing taxes and expenditure, he obtained an estimated defect on the year's Budget of £74,000,000, but, looking ahead, he found the appalling figure of £72,000,000 the thing the said of £72,000,000 the thing all the said of £72,000,000 the said of £72,000,000 the said of £72,000,000 the said of £72,000,000 the said of £72,000,000 the said of £72,000,000 the said of £72,000,000 the said of £72,000,000 the said of £72,000,000 the said of £72,000,000 the said of £72,000,000 the said of \$72,000,000 the said o of £170,000,000 deficit on next year's Budget Mentioning that nine-tenths of the items under which economies were proposed were approved by the late Government, Mr. Snowden said that the Government had decided that the proposed Sinking Fund provision should be £33,500,000, which, with certain necessary adjustments, produced a savung of £13,500,000. He proposed to increase the standard rate of income tax for the current year by 6d., making it 5s. in the pound, and to alleviate the burden of the increase ou industry the allowance made in respect of wear and tear on plant and machinery would be increased by so per cent. A very large number of persons at present paying no income tax would be brought within the range of payers by reducing the personal allowance for a single person from £335 to £100, and for a married person from £355 to £100, while the allowances for children would be reduced from £65 to £55 for the first child and from £65 to £55 for the first child, and from £50 to £40 for other children. The amount on which half the standard rate would be paid was reduced from £250 to £175, but the allowance in respect of earned income would be increased from one-sixth, with income would be increased from one-sixth, with a maximum of £300. He expected a yield from the changes of £35,000,000 this year, and £51,500,000 next year. In addition he anticipated £4,000,000 this year and £6,000,000 next year from an increase of no per cent, on the amount of the surtax bill. The duties on all perfusive descriptions of hear would be forecased. methods of balancing the nation's Budget, and amount of the surfax bill. The duties on all the Labour Government resigned on Aug. 25.
Two days later Mr. MacDonald formed the National Government, the Cabinet consisting of tobacco by 8d. a point i, and on petrol by 8d. a representatives of Labour, Conservatives and Liberals. Parliament met specially on ments duty, representing a penny in every sixin regard to next year the enanges would oring in £372,00,000 against the estimated deficit of £170,000,000. Finally, Mr. Snowden said that the Finance Bill would include clauses the facilitate the conversion of the 5 per cent War Loan to a lower rate of interest. He had tied, he declared, to spread the burden as fairly and as evenly as human ingenuity could devise, and he believed that the country would accept the pro-posals and give the world an example of the indomitable British spirit in the face of difficulty. Mr.Graham criticised mainly the "cut" in unemployment benefit, and Mr. Runciman suggested that the importation of foreign luxuries should be prohibited. The Finance Bill was brought in on Sept. 17, and the second reading was obtained six days later by 297 to 238. When the third reading was agreed to on Oct. 2, Mr. Showden claimed that it would place the country's finances on a sound basis. The Bill went through the House of Lords and received the Royal Assent on Oct. 5.

THE ECONOMY BILL.-The main saving to the Exchequer was secured by Orders in Council empowered by the National Economy Bill which was explained by the Prime Minister when moving the second reading on Sept. xx. The economies were in expenditure falling to be defrayed out of public moneys, and were in respect of education, national health insurance, and public more proposed to the second se unemployment insurance and roads. Mr. Mac-donald said that the Orders could only be issued within one month after the passing of the Bill, so that the Government's power lapsed. Under their scheme \$70,000,000 was to be found by economies and \$30,000,000 by taxation. They were carrying on the policy actually begun by the late Government. After explaining the cuts

in teachers' salaries, and police and services pay the Prime Minister said that the reduction in unemployment insurance seemed to be the hardest of the economies. They had adopted the straightforward course of taking off a percentage based upon the decreases in the cost of living and increases in the value of money, and he contended that the state of the unemployed was 1½ per cent. better than two years earlier. The second reading was carried by 3xe to 253 on Sept. 14, and after several amendments had been defeated in Committee the third reading was agreed to by sey to 242 on Sept. s8. Two days later it had been passed by the Lords and received the Royal Assent.

GOLD STANDARD SUSPENDED. - Yet another sensation came on Sept. 22, when it was amounted that on the previous day the Government had decided, after consultation with the Bank of England, to suspend the Gold Standard for the time being. On the same day a Bill for this purpose was passed through all its stages and received the Royal Assent. Mr. Snowden explained that it suspended the obligation of the Bank to sell gold until such time as that obligation was restored by Royal Proclamation, in-demnified the Bank for refusing to sell gold that day, and gave the Treasury power during the next six months to make and vary any measures they wished for controlling the exchanges. Mr. Henderson said that there was no need for panic, but he did not dispute the necessity for emergency powers.

THE DISSOLUTION —After the passage of a Bill to prevent the exploitation of foodstuffs, the Prime Minister announced on Oct. 6 that Parliament would be dissolved on the following day, and that polling day for the new House of Commons would be Oct. 27. In the King's Speech, read on the prorogation, His Majesty expressed himself confident that every citizen would co-operate in restoring prosperity to the nation.

OFFICERS OF THE HOUSE OF COMMONS.

Speaker (re-elected Nov. 3, 1931), Capt. The Rt. Hon. Edward A. FitzRoy, M.P. for Daventry £5,000 Secretary, Lt. Col. Sir Ralph Verney, C.LE., C.V.O. £700 Chairman of Committees, Sir D. H. Herbert, K.B.E., M.P. £3,000 Deputy Chairman, Capt. R. C. Bourne, M. P. £3,000 Temporary Chairmen (unpaid),

Clerk of the House of Commons, Sir Horace Christian Dawkins, K.C.B., M.B.E.......£3,000 Clerk Asst., Gilbert F. Montriou Campion£1,800 Second do., F. W. Metcalfe£1,200 Principal Clerk Public Bill Office, and Clerk of the Fees, Bryan Fell£1,000 to £1,200

£1,000 to £1,200 Senior Clerks, Sir J. S. Horsburgh-Porter, Bart.; C. R. Turner; W. K. Gibbons; O. C. Williams; G.W.B. Throckmorton; B. H. Coode; A. W. M. Bull; C. R. P. Diver; E. A. Fellowes; R. A. W. Dent

each £650 to £900

Assat. Clerks, L. A. Abraham; N. L. Lockton; S. St. G. S. Kingdom; E. J. H. Edenborough; D. J. Gordon; B. St. G. Dreunan; K. R. Mackenzie; S. C. Hawtrey; S. Gordon; T. G. B. Cocks;

J. S. Crawford; H. R. M Farmer John Serjeant-at-Arms, Adm. Sir Colin Keppel, C.M.G., C.V.O.

Chaplain to the Speaker, Rev. Canon Wm.

Examiner for Private Bills and Taxing Officer, Lt.-Col. Sir Ralph Verney, C.I.K.,

The Bouse of Commons.

The eighth Parliament of King George V., elected on October 27, 1931. 472 Conservative; 13 National Labour; 35 Liberal Nationalists; 33 Liberals; 3 National Independents. Total for National Government, 556. Labour 52; Independent Liberals 4; Independents 3. Total against National Government, 59.

THE GENERAL ELECTION OF 1931.

THE result of the General Election of 1931 is shown in tabular form below. The Electorate numbered approximately 30,000,000, and if the voters in uncontested constituencies (2,358,000) are deducted the number of electors who recorded their votes amounted to seven-minths of the remainder. In 1832 the electors numbered about 1,000,000, increased to 2.500,000 in 2867, 5,000,000 in 1884, 21,000,000 in 1918 (when women of 30 were enfranchised), and to 28,850,000 in 2929 (women having the vote on the same terms as men).

"Right Honourable."—Members of His Majesty's Most Honourable Privy Council are entitled to be designated "The Right Honourable," but, in practice, this prefix is sometimes absorbed in other designations; for example, a Prince of the Blood admitted a Privy Counsellor romains "His Royal Highness"; a Duke rounds "His Grace", a Marquess is still styled "Most Honourable" In the case of Early, Viscounts and Earons a question has lately been raised whether peers of these three degrees are entitled to be called "Right Honourable" if not Privy Counsellors. While not presuming to make a statement in settlement of the question, the Edutor feels bound to direct attention to the rectal of Modes of Address of Peers of these three degrees (on pages 173, 172 and 182 of present Edition). The Style appearing these headings has been ecited in this manner for more than sixty years in Whirter, and appears to be evidence of a long-standing cuttom, moreover, it is borne out in each instance, in A Minited of Dignities, by C. R. Dodd (Whittaker & Co. 1842), and in The Book of the Court, by W. J. Thoms, v.s.a., "Dedicated by Command to the Queen" [H. G. Bohn, 1844]. Earlier evidence of the courtesy could no doubt be produced. Chief Magistrates entitled to the prefix are found on p. 533.

Bovernment and Public Offices.

SNOTE AS TO SALARIES.

THE salaries shown in the 1932 WHITAKER, in the case of H.M. Judges and of Government Departments, are subject to abatement in accordance with the decisions of His Majesty's Government. These abatements, which are set out in Command Paper Number 3952, in various Treasury Circulars, and answers to Parliamentary questions. may be summarised as follows:

(a) Ministerial valaries

£5,000 a year and over, 20%; £2,000 a year and over, but under £5,000, 25%;

under £2,000 a year, 10%.
(The salaries of the Attorney-General and Solicitor-General have been reduced to

£3,000 a year plus fees.) (b) Other salaries

£5,000 a year and over, an abatement of \$5,000 a year and over, an shacehell of \$7.5 \(\frac{1}{2}\), \$000 a year and over, but less than \$\mathcal{L}_5,000, \$10\), subject to the provise that the remuneration of any officer in receipt of over \$\mathcal{L}_6,000 a year, but less than \$\mathcal{L}_5,000, ahall be \$10\), less or such larger amount as will suffice to reduce his remuneration to

£4,000. Salaries of £1,800 a year and over, but less than £2,000; such abatement as will suffice to reduce remuneration to £1,800.

THE COST OF LIVING BONUS

In the year 1920, in order to counteract the increase in the Cost of Living the Government introduced a Cost of Liming Bonus Scheme, under which salaried Civil Servants and wage-earning Government employees receive temporary additions to their salary or wages. The scheme was applied, irrespective of age or sex, as from was applied, respectively of the addition in any case being £750 per annum. In general, salaries under £2,800 a year, except where described as inclusive, are supplemented by the grant of a cost of living bonus on a sliding scale.

The Government Scheme was adopted generally

by Public Authorities, certain modifications being made in particular instances

The standard cost of living in March, 1980, was 230 per cent. in excess of that of July, 1924, and the scheme of increase agreed by the Whitley Council on the basis of that figure was as follows :-

the hasis of that figure was as follows:—
Where the ordinary rate of remuneration does not exceed 300 per week—200 per cent, increase
Where the ordinary rate of remuneration exceeds 300 per annumation exceed the ordinary rate of remuneration exceeds as a week, but does not exceed \$500 per annumation exceed the ordinary rate of remuneration exceeds \$500 per annum—250 per cent, on the first \$50 \$50, and \$50 per cent, on the next \$500 per cent, on the

The standard rate rises or falls x twenty-sixth in response to every five points rise or fall in the Index figure average of prices over a six months period.

In addition to the reduction caused by the automatic decline of the cost of living figure the following decreases have been introduced :-

nowing decreases have confined under your sper cent on salaries from £500 to £500, so per cent on salaries from £500 to £500, so per cent on salaries from £500 to £500, and so on until 60 per cent, is reached in the case of salaries of £1,500 a 708r

From September, 1931, bonus is related to an average cost of living figures of go per cent. over the 1914 level.

The following are examples of the bonus at present payable (i.e. the standard rate, decreased by sixteen twenty-sixths):—

Annual Salary.	Bonus Sept., 1931.	Weekly Wages.	Bonus Sept , 2931
£	£ 8.	ж. d.	s. d.
õ	45 0	14 0	7 0
150	59 4	15 0	7 6
200	70 14	17 0	8 6
250		zŠ o	90
300	79 8 88 o	20 0	10 0
400	105 7	30 0	15 0
500	122 13	40 0	18 8
600	126 O	50 0	SO II
700	133 13	60 o	23 3
800	139 13	70 0	25 7
900	143 18	80 0	27 8
1,000	146 Q	90 0	29 5
7 750	50 O	100 0	31 2

Further examples, showing the bonus expressed as percentage of salary, are appended :-

Halary	Bonus	Bonus expressed as Percentage of Salary
£	£ ≉	7
90	45 0	' 50
150	59 4	39'5
250	79 8	31.8
500	F22 13	24'5
1,000	146 Q	24'6
r,500	133 #	8.0
1,750	50 0	3.0

Payment of bonus is subject to the proviso that no bonus is payable so as to bring total remuneration, inclusive of bonus, above £1,800.

SMINISTRY OF AGRICULTURE AND FISHERIES.

Whitehall Place, S.W. x: 43 Parliament Street, S.W. x, 7, Old Bailey, E.C. 4; 8 Buckingham Gate, S.W. z.

THE MINISTEY OF AGRICULTURE AND FISHERIES WAS caustituted pursuant to the Ministry of Agriculture and Hisheries Act, 1259 (§ and 10 Geo. V Ch. 51 which nucesided the Board of Agriculture and Fisheries Act, 2559 (1796). The Board of Agriculture for Great Britain was established in 1259. By the Board of Agriculture and Fisheries Act of 1269, the duties of the Fisheries I was established for 1269, and 127 and were transferred to I would be a support to the Source of Trade were transferred to be a support to the Source of the Control of the Source Survey and of Kew Gardens is under the control of the Ministry.

THE COUNTY PALATINE OF DURHAM.

Consider of Lancaster Casile, J. Travis Travis-Glegg
THE COUNTY PALATINE OF DURLAM.

It is uncertain when "Palatine" privileges were first
exercised in the County of Durham, as no formal creation
of the Palatinate by The County of Durham, as no formal creation
of the Palatinate to the County of Durham, as no formal creation
of the Ree of
Jandistane, out of which the hishopric and palatinate
of Durham arose, the Hishops received large smate of
lands, with extensive immunities; and duthred, king of
Northmubria, and Alfred the Great appear to have confirmed the grant to the Nee of the whole of the land
between the rivers Tyne and Wear There is no exidence
of the exercise of palatine privileges by the Bishops prior
to the Norman Conquest, but it is probable that these
were acquired in the reign of the Conqueror, and they
were exercised by the Prelates until resumed by the
Urown in 1826. Palatine counties are understood to
have been erected for the defence of neighbouring hing
doma against the Welsh and Scota, and were in reality
eff-contained kingdoms in alliance with their creator
The anoient customs of the County Palatine of Iurham
are in some measure retained, the attinistrative
authority being exercised on behalf of the Jown.

BOARD OF EDUCATION, Whitehall, London, S.W. z.

WHITCHAII, LORGOR, S. W. T.

The Government Department of Education was, until
the establishment of a separate office, a Committee of
the Privy Council appointed in 439 to supervise the distribution of certain grants which had been made by
Parliament since 439. The Act of 4399 established the
Board of Education, with a President and Parliamentary
Secretary, and created a Consultative Committee The
cost of administration was estimated at £324.28 in
the Financial Year 1933, with £355 69 for Inspection
and Examination
THE BOARD THE BOARD.

RMIGRANTS' INFORMATION OFFICE (see Oversea Settlement Department, p. 201) & EXCHEQUER AND AUDIT DEPARTMENT.

§ EXCHEQUEE AND AUDIT DEPARTMENT,
Victoria Embankment, E.C. 4.

This is the Department of the Comptroller and Auditor General, an office created by the Act sp & s Vict. c. 9 1988; to replace, with extended powers, the separate offices of Comptroller General of the Receipt and Issue of the Exchequer and of the Commissioners for Auditing the Exchequer and of the Commissioners for Auditing the Exchequer and of the Comptroller General of the except upon an address from the Two Houses of Parliament. In his capacity of Comptroller General of the Receipt and Issue of the Exchequer he authorises all issues from the Exchequer after satisfying himself that Parliament has given authority for them. He examines the Exchequer accounts and makes an annual report to them to Parliament. In his capacity of Auditor General of Public Accounts he is charged with the duty

of examining on behalf of the House of Commons the accounts of expenditure out of monies provided by Parliament, the accounts of the receipt of revenue, and generally all other public accounts, including the accounts of Government stores and of trading services conducted by Government Departments. The results of his examination of those accounts are reported to the House of Commons.

The net expenses of the Department were estimated to amount to £148,650 in 2009-1830 Comptroller and Auditor General, Gilbert Charles

GENERAL REGISTER OFFICE

(ENGLAND AND WALES),

(ENGLAND AND WALES),

Somerset House, W.C. z.

The Registration of Births, Marriages and Deaths is believed to have been inaugurated by Thomas Croming in the State of a comparatively modern date, and were consolidated by 75 g 9 Vol. c. 08. The first Registrant-General was applied to the state of the Census Returns. He also undertakes the verification of claims by applicants for Old Age. Widows, &c. and War Pensions The expenses of the Office including the cost of the Census for roccipits from fees for the same period is £50.500.

Quarterly Statistics—In the Registrant-General's report

receipts from fees for the same period is £56,300.

Quarterly Statistics.—In the Registrar-General's report for the June quarter of 1932, the estimated birth rate is given as \$8 given as 50 per 1,000 population, which is the lowest of the establishment of civil registration. The estimate the establishment of civil registration. The period destinate was 12 per 1,000, this being 03 per 1,000 about the rate recorded during the second quarter of last year. The natural increase of population for the June quarter, 1932, by excess of births over deaths as 49,742 as against 55 255, 59,723 and \$5.850 in the second quarters of 1928, 1939 and 1930 registration of the persons married in the March quarter of 1932 was 49,300, a decrease of 4,365 compared with the number in the corresponding quarter of 1933. The number corresponds on annual rate of 9,5 per 1,000 of the pre liminary 1932 Census population.

ODE MITTEE.

The Royal Commission on Honours, 1922 recommended that a Committee should be appointed to consider, before they are submitted to the King the names and particulars of persons recommended for appointment of any dignity or honour on account of political services, and after such inquiry as they think fit to report to the Prum Minister whether, so far as they believe, such persons in the whole circumstances are fit and proper persons to be recommended hecretary, James Rae (Treasury, S.W. z).

IMPERIAL ECONOMIC COMMITTEE. a Queen Anne's Gate Buildings, S.W. z.

2 Queen Anne's Gate Buildings, S. W. z.
This Committee was established in 1995, following on proposals of the Imperial Economic Conference, 1995, for the purpose of considering the possibility of improving the methods of preparing for market and marketing within the United Kingdom, the products of the Overseas parts of the Empire, with a view to increasing the consumption of such produces in the United Kingdom in preference to imports from foreign countries, and to promote the interests both of producers and consumers. The imperial Conference of 1995 further withened the reference to the Committee in the following terms of

ference :—
(3) To investigate the marketing of Empire foodstuffs in the United Kingdom
(a) To undertake inquires into the production for export and the marketing in various parts of the world of run materials of the Empire (3) To prepare, at the instance of the Governments of the Commonwealth, surveys of any branch of Empire trade and marketing
(4) To carry out certain in estigations adopted by the (5) To facilitate conferences among those engaged in particular industries in various parts of the Empire
(6) To examine and report on any economic question

Empire

(6) To examine and report on any economic question which the Governments of the Empire may agoes to refer to the Committee.

The Committee has published eighteen reports: The first a general report, and reports on meat, fruit, darry produce, fish, poultry and eight, honey, functions and work of the Committee, tobacco, timber, agricultural machinery, pigs and pig products, the trade of the British Empire, rubber manufactured goods, hides and skins, progress report (1930), tea and coffee "harrmans, Sir Schoep J. Chapman, E.C.B., C. B...

Secretary, Sir David Chadwick, C.S.I., C.I.E.

IMPERIAL SHIPPING COMMITTEE.

Great George Street, 8.W. .

Set up in 1900 (a) 10 enquire into complaints from persons and bodies interested with regard to ocean freights, racilities and conditions in the inter-imperial trade or questions of a similar nature referred to them by any of the nonmatting authorities, and to report their conclusions to the Governments concerned (ii) To survey the facilities for maritime transport on such routes as appear to them to be necessary for trade within the Empire, and to make recommendations to the proper authority for the co-ordination and improvement of such facilities with regard to the type, size and speed of ships, depth of water in docks and channels, construction of harbour works and similar matter; and in so doing to take into account facilities for air transport on the routes in question. Like the Imperial Conomic Committee, it derives authority from and reports to all the Governments represented at the Imperial Conference. Charrman, Rt. Hon. Sir Halford Mackinder. Secretary, R. M Nowell,

Lincoln's Inn Fields, W.C. a; and as Portugal
Street, W.C. a.

H. M. Land Registry was established in pursuance of a
recommendation of a Royal Commission by the Land
Registry Act 1856. The aim of the Act was to render
dealings with land more simple and economical by establishing a State register of landowners who voluntarily
submitted the titles to their land for examination and
approval by the Registrar on behalf of the State. The
Registry was reformed by the Land Transfer Act 1875,
which, while making many changes in the system, continued its voluntary basis. In 1897 the Land Transfer
Act introduced the principle of compulsory registration,
and ages made the system compulsory or make in the administrative county of London. By a further Urder
made in 1828 Registration was made compulsory or
sale in Eastbourne, and under an order made in 1928
in Hastings The Land Registation Act 1925 consolidated the previous Acts and made such changes in the
system as the experience of a generation had shown
to be necessary. The keynote of the system is that the
machinery for the pure hase and sale of land is accimilated
to that for Stocks and Shares. Absolute titles granted
by the Members of the system is that the
machinery for the pure hase and sale of land is nedministed
to that for Stocks and Shares. Absolute titles granted
by the Members of the system is that the
machinery for the our hose and and it is open to
any County Council for Council of a County Rorough to
apply to the Privy Council for an order making registration of title compulsory in its area. The Land Registry
is administered under the Lord Chancellor by the Chief
Land Registry and also controls the Middlesox Deeds
Registry and the Land Charges Department under the
Land Charges Act 1828

Students' days, Tuesday and Wednesday, 6d; ther days free. For hours and Sundays see other days free. National Gallery.

NALIORAL USAIGTY.

The National Gallery, Millbank, better known as "The Tate tiallery," was opened in 1297 on the site of Millbank Gaol, the cost of errection (£20,000) being borne by Sir Henry Tate, who also contributed the nucleus of the present collection. The "Turner Wing," built at the expense of the late Sir Joseph Duveen, Senr, was opened to the public in 1300. The Gallery now includes a gallery for Modern Foreign Art and a gallery for Sargent's works, opened in 1305, the gift of Sir Joseph Duveen.

. . . £1,000 £250 to £600 £250 to £600 **ONATIONAL PORTRAIT GALLERY.**

St. Martin's Place, Charing Cross, W.C. z.

OPATENT OFFICE

(and Industrial Property Department, Board of Trade), as Southampton Buildings, W.C. s.

The prerogative of the Crown to grant monopolies was limited by at James I. c. to the grant of Letters Fatent for New Inventions, and the control of such grants was limited to the Board of Trade by \$6 & 47 Vict. o. gr. The duties of the Department, which deals mainly with the granting of patents, the registration of designs and trade marks, and with questions relating to literary and artistic copyright, are performed by a Comptroller-General with a staff of officials. For the year age the expenditure was £64,290, and the revenue from fees, &c. was £586.475.

SPAYMASTER GENERAL'S OFFICE.

Whitehall, S.W. z.

The Paymaster General, 8. W. z.

The Paymaster General to office was formed by the consolidation in zigg of various separate pay departments then existing, some of which dated back at least to the Restoration of zige. Other offices were incorporated in zigg. Its function is that of paying agent for the different Government Departments, other than the Revenue Departments. The majority of its payments are made through banks (to whose accounts the necessary transfers are made at the Bank of Regisand), but cash payments are also made, and the payment of pensions is an important feature of its work. The Establishment expenses were estimated at zigg.co in zggz-zg.

SPOST OFFICE.

Chief Office, St. Martin's-le-Grand, B.C. z.

Chief Office, St. Martin's-le-Grand, E.C. z.

A House of Commons report in the states: "It is
uncertain at what predicts period the Crown undertook
to be the regular carrier of letters for its subjects." The
first "Master of the Posts" was appointed in sign, bet,
the duty was not then undertaken as a femunerative
department of the Government. The Post Office is now
one of the three great revenue-collecting departments,
and while efficiently discharging its multifations duties,
shows a large annual profit. It also receives large sums
for duties and taxes on behalf of the Inland Revenue
Bepartment, for certain fleaness for the Cuptoms and
Excise Department and the County Councils, and for
National Insurance on behalf of the National Health
neurance Commissioners and the Board of Trade. The
Post Office also pays Widows'. Orphans and Old Age
Pensions, and Navas, Military and Air Force Pensions
and Allowances. The Penny Fost was inaugurated in
state, the Book Toot in sign, the Cook Counter Service in sign,
such counter of the Counter of the Service of the Counter
Post in Sign, and the Telephone Service in sign. The
expenses of the Post Office (Selaries, Wages, etc., only)
were estimated at £35,368,38; in rege-yx

OPRIVY COUNCIL OFFICE, Whitehall, S.W. 2.

openivy council is of very ancient origin. A Council, the number of which was about twelve, as instituted by Alfred, 895, and it discharged the functions of State now confined to members of the Cabinet. In the Middle Ages the Chief Advisers of the King who were permanently about him formed the Privy Council. Having become unwieldy, it was reconstituted in 159, At present it consists of certain eminent persons whose names are given out pp. 139-5. Members of the Cabinet must be Privy Council. The Council is summoned as such to act. "with others" upon the demise of the Crown, and many matters are referred by the Sovergian Committees, and others constituted to deal with particular cases, eq., the Judicial Countitee, the Foard of Trade, qs. The Lord President of the Council is at Privil Council of Trade, qs. The Lord President of the Council is a Privil Council of Trade, qs. The Lord President of the Council is a prominent member of the Cabinet.

QUEEN ANNE'S BOUNTY, 3 Dean's Yard, S.W. r.

Incorporated in spea, when Queen Atme, with the consent of Parliament transferred to the Governors the samual income of the "first fruits" and "tenths" derived from the sees, dignities, and benefices, with a view to, the sugmentation of insufficiently endowed lyings. By the First Fruits and Tenths Measure, 1986, these payments have been extinguished with a few exceptions. The surplus income from capital held by the Givernors is distributed in grants towards the relief of dilapidation assessments on benefices not exceeding \$500 in net annual value; the total amount so available for the year ended Dec. 21, 1999, was \$50.495 They are the Central Authority under the Recleatistical Philapidations Measure, 1985, and important duties have been last upon them in connection with ecclesiastical title rentedrage under the Title Act, 1985. The tovernors act as trustees for endowments and many descriptions of Unitry funds They are also empowered to lead money upon mortages of benefices for improvements to parsonage houses and farm buildings, and for dilapidations.

A Council for Trade and Flantations was invittated by
A Council for Trade and Flantations was invittated by
King Charles II, in 1600 This paid Council was abolished
in 1700 and in 1700 the Patent Council Council on Trade
(which, unlike the other Council Council on Trade
(which, unlike the other Council Committees, had a
President of its own) was appointed The President of
the Board of Trade, as at present constituted, controls
the Department principally responsible for matters
relating to trade and industry. The Board is concerned
with international, commercial, and industrial policy
and administers certain statutes including those relating to merchant shipping and seamen, bankruptcy,
joint stock companies, gaz, key industries, marchandise marks, othermatograph films, weights and
measures, patents, designs, trade marks and copy"Adding." (See also Dept. of Overseas Trade, and Pateut Office.)

right, and mines and quarries. It administers the Coastguard, and also exercises control over the principal lighthouse authorities control over the principal lighthouse authorities on tidal lands. It collects and publishes statistics of the trade and industry, shipping and navigation of this country, its Dominions and Protectorates, and foreign countries, as well as particulars of customs tariffs, regulations &c., and publishes a weekly journal of commercial information. The Food Council is attached to this department. The Department arranges the proxision of all sea transport required for the conveyance of personnel and stores by the fighting services and other Government Departments. In addition tundertakes duties arising out of the War, the most important now remaining being those of the Clearing Office for Emery Beits. Jointly with the Foreign Office it controls the Overseas Trade Department.

(TREASURY, Whitehall, S.W. z.

GTREASURY, Whitehall, S.W. z.

The Lord High Treasurer of England is the Third Great Officer of State, the office having been "in commission" (with certain intervals) since size. The Commission" (with certain intervals) since size. The Commission of the Treasurer of the United Kingdom consist of the Commission of the Treasurer and a staff of officials. The duties of the First Lord are mainly political, as also are those of the Parliamentary Secretary and the Junior Lords; the duties of the Chancellor of the Exchequer are mainly financial, in that be performs the ancient duties of the Under-Treasurer and, after agreement with the heads of the great spending departments, arranges for the great collecting departments to provide sufficient memery to meet the needs of the year. The papers are laid before Parliament in the form of a Budget, which the Chancellor opens and expounds to the Hotse these plans being accepted, modified, or rejected by the House

§ Law and Justice.

APPRILATE TRIBUNALS.

THE JUDICIAL COMMITTEE OF THE PRIVY COUNCIL.

Office, Downing Street, Whitehall, S.W. r. The Supreme Judicial Authority of the Empire is the Judicial Committee of the Privy Council, before which appeals may be brought (in the form of a petition to the Crown) from Consular Courts and Courts of Vice-Admiralty, and from the Courts of India and every British Dominion. The Judicial Committee of the Privy Council consists of the Lord Chancellor, Lord President, ex-Lords President, the Lords of Appeal in Ordinary (see col. s), and such other members of the Privy Council as shall from time to time hold or have held "high Judictal Office" within the meaning of the Appellate
Jurisdiction Acts, 1876 and 1887. Among the last
are included Viscount Hallsham, Lord Buckmaster, Lord Darling, Lord Warrington of Clyffe and Lord Salvesen. Sir John Wallis is a member by virtue of section 30 of the Judicial Committee by virtue of section 30 of the Judicial Committee Act, x323; Sir George Rivers Lowndes and Sir Dinshah F. Mulla (Appellate Jurisdiction Act, x349); and the following judges from the Dominions heyond the Seas (various Acts, x369-293):—Sir Charles Fitzpatrick (Canada), Sir James Rose Innes (S. Africa); Mr. Justice Lynan Poore Duft (Canada - Supreme Court); Sir Adrian Knox (Australia); Sir Isaac Alfred Isaacs (Australia). (Authorities); Bit Alexander Anglin (Canada— Chief Justice Francis Alexander Anglin (Canada— Supreme Court); Chief Justice Sir William Mulock (Ontario); Sir Lancelot Sanderson (Bengal), and Chief Justice Jacob de Villiers (South Africa—

.....£800 Second Clerk, D. G. Lys £450 THE HOUSE OF LOEDS."

in Scotland the principal local court is the Sheriff Court. The Judge Ordinary is the Sheriff-Substitute, and the Sheriff is an Appeal Judge. The jurisdiction of the Sheriff Court is both civil and criminal. In civil quest lone the jurisdiction is unlimited in regard to the money value of the cause. On the criminal side the Court has ocguzance of all serious crime with the exception of murder and three other charges, but the prisonment; it does not extend to senal servitude.

The Sheriff Clerk is the Clerk of the Sheriff Court, and his duties correspond nearly to those of a Registrar in the English Courts.

Prosecutions are conducted by Crown officials

Prosecutions are conducted by Jrown omerase at the public expense; the Lord-Advense and his deputes presente in the High Coart; the Procurators-Fiscal in the Sheriff Court. The Convener of the Sheriff is Sheriff Alexander-L. M'Clure, Aberdeen.

The Address of the Secretary of the Sheriffs-Substitute Assoc. is County Buildings. Ayr.

ADOPTION OF CHILDREN.

In England and Wales the adoption of children In England and water the adoption of children Act, is regulated by the Adoption of Children Act, read. An Order of Court is necessary to legalize the adoption, and the Act provides a number of safeguards. Adoption puts the child adopted practically on the same footing as a child born to the adopter in lawful wedlook, in all matters of custody, education and maintenance; but does not alter the child's rights in property of his real parents (e.g., on intestacy) nor give the child rights in respect of the adopter's property. The Act provides for a register of adopted children. Applications are made to the High Court (Chancery), County Court, or Magisteria: Bench. Orders will not usually be made for a man to be sole adopter of a girl, and applicant must be twenty-five years of age, or older.

Scotland.—The Adoption of Children (Scot-

Scotland.—The Audphon of Chinaran (Scotland Act, 1930, makes similar regulations for Scotland as from Oct. 1, 1930, and directs the Registrar-General for Scotland to establish and maintain an Adopted Children Register. Applications are made to the Court of Session, or the Sheriff Court within whose jurisdiction either the applicant or the child resides at the

date of application.

BIRTHS (REGISTRATION).

(For Certificates, see p. 257.)

WHEN a birth takes place, personal information of it must be given to the local Registrar of Births and Deaths, and the register signed in his presence, by one of the following persons:

1. The father or mother of the child. If they fail, 2. The occupier of the house in which the birth happened; 3. A person present at the birth; or, 4. The person having charge of the child. The duty of attending to the registration therefore rests firstly on the parents. The registration must be made within 4s days of the registration must be made within a days of the birth. Failure to do this without reasonable cause, involves liability to a penalty of forty shillings. If at the end of 4s days the birth is not registered, the Registrar may require any one of the above-mentioned persons to attend to register at a stated time and place. Failure to comply involves a penalty of forty shillings. The registration of a birth will be free when it takes place within 4s days (in Scotland ar days), unless the Registrar is requested to attend at a residence or at the house where the child was horn, when he may claim a fee of one shilling After three months a birth cannot be registered except in the presence of the Superintendent except in the presence of the Superintendent Registrar, and on payment of fees, amounting to five shillings, to him and the Registrar After twelve months no birth can be registered without the Registrar-General's consent, and on payment of further fees, amounting to ten mayment or nurveer rees, amounting to ten shillings. In Scotland, after the lapse of three months, it can only be registered on the authority of the County Sheriff. The regula-tion that no birth in England and Water could be registered after seven years was revoked in ross, but late registration cannot be allowed unless satisfactory evidence is supplied to the Registrar-General. The only legal proof of age and place of birth is afforded by the civil registers, which the law now requires to be made as above described. In districts under the Notification of Births Act, 1907 (as extended by an Act of rgrg), notice of every 6. Any person born out of His Mejesty's birth must be given by the father, or person in dominions whose father was at the date of the

attendance on the mother, to the district medical officer of health by post within 36 hours of the birth. This is in addition to the registration already mentioned.

A "Stillbirth" must be registered, accompanied by either a certificate of doctor or midwife, or a declaration that no doctor or midwife was present at the birth, and that the child was not born alive.

The re-registration of the birth of a person under the Legitimacy Act, 1926, is provided for in that Act (see p. sor).

Birth at Sea. The master of a British ship must record any birth on board and send particulars to the Registrar General of Shipping.

Birth Abroad Consular Officers are authorised to register births of British subjects occurring in their districts.

BRITISH NATIONALITY.

The law as to British Nationality is mainly to be found in the British Nationality and Status of Allens Act, xgra, as amended by certain Acta passed in xgra and xgra. It is important to notice that the Act of xgra—which defines a natural-born British Subject—does not affect the status of any person born before Jan. z. TOIS.

The following are deemed to be British Sub-

jects, namely:

z. Any person born within His Majeaty's dominions and allegiance.

2. Any person born out of His Malesty's Dominious, before Jan 1, 1915, whose father's father was born within His Majesty's Dominions,

rather was norn within this Majesty's Dominions, provided that the grandfather was, at the time of the father's birth, a British subject.

3.* Any person to whom a Certificate of Naturalization has been granted, or who has acquired British nationality by reason of annexation of territory, or by special Act of Parliament.

4. The wives (whatever their nationality of origin) of British subjects, save in certain cases where the man changes his nationality after marriage.

5. The children of naturalized British subjects born out of His Majesty's Dominions, provided that they comply with one of the following conditions :-

(a) in the case of a child born before January

rat, rgrs,
(i) if a Certificate of Naturalization has been
granted to his father or his mother
(being a widow) before January 1, rgrs,
and he has become resident with such father or mother (being a widow) in the United Kingdom before that date while

(ii) if a Certificate of Naturalization is granted to his father or his mother (being a widow) after January z, zozz, and his name is included therein.

(b) in the case of a child born after January r.

1915,
(i) if before his birth a Certificate of Naturalization had been granted to his father or his mother, or

(ii) if a Certificate of Naturalization is granted to his father or his mother (being a widow) after January 1, 1913, and his name is included therein.

birth a British subject, and who fulfils any of the following conditions—e.g., if either
(i) his father was born within His Majesty's

allegiance; or

(ii) his father had a certificate of Naturaliza-

tion; or
(iii) his father had become a British subject
by reason of any annexation of territory;

(iv) his father was, at the date of the birth, in the service of the ('rown; or

(v) his birth was registered at the British Consulate within one year or, in special cases, two years or in the case of a person born on or after January 1, 1915 who would have been a British Subject if born before that date, within as months after August 1, 1922.

A child of a British Subject is deemed to have been born within the allegance if born anywhere where by treaty, &c. His Majesty exercises jurisdiction over British subjects.

A person whose British nationality depends upon his registration at a Consulate ceases to be a British Subject unless he asserts his nationality by declaration within a year after attaining az, and abandons any other nationality he may have acquired.

7. A person born on a British shin.

LOSS OF BRITISH NATIONALITY .-- A British subject loses his British nationality :-

(a) if by any voluntary or formal act he be-comes naturalized in a foreign country;

(b) if, in certain cases, he makes a declaration of alienage. These cases are:—

(i) where a person is a British subject by reason of birth in His Majesty's Dominions and allegiance or on board a British ship and is also by birth or becomes during minority a subject of any foreign State,

(ii) where a person is a British subject, but was born out of His Majesty's Dominions.

- (iii) where a Convention has been made between this country and any foreign State, to the effect that any subject of that state who has been naturalized as a British subject may divest himself of
- that Status;
 (c) if during his minority his father loses British nationality in circumstances which involve the acquisition by the child of a new nationality;

(d) in the case of a woman, if she marries an

alien;

(N.B. A woman who was originally a British subject and loses British nationality by mairiage with an alien does not regain British nationality on the death of hus-band or the dissolution of her marriage. If in such a case she desires to resume British nationality she must apply for a Certificate of Naturalization.)

(e) in the case of a person to whom a Certifi-cate of Naturalization has been granted if the Secretary of State revokes the Certificate ;

(f) if the territory of which he is an in-habitant is severed from the Crown; cf., e.g., the cases of the inhabitants of Hanover and Heligoland.

ACQUISITION OF BRITISH NATIONALITY.—An alien may acquire British nationality:—

(a) by special Act of Parliament :

(b) by the conquest, annexation, or cession of the territory of which he is an inhabitant;

(c) in the case of a woman, by marriage with a British subject, and

(d) by naturalization.

Naturalization —All Certificates of Naturalization granted in the United Kingdon between May 13, 1890, and December 21, 1914, were granted in accordance with the provisions of the Naturalization Act, 1890. And this Act did not secure that a Certificate granted in any part of the Empire should be valid throughout the Empire.

Under the British Nationality and Status of Aliens Act, 2014, every person to whom a Certificate of Naturalization is granted in accordance with its provisions after January 1, 1213, is a British subject, not only in that part of the British Empire where the Certificate is granted, but also in the United Kingdom and in any Dominion which has adopted the Act, and in any other British Possession.

Persons naturalized prior to January 1, 1915 may, after that date, apply for a fresh Certificate of Naturalization under the new conditions.

In order to be eligible for the grant of such a Certificate in the United Kingdom, an alien

(a) during the eight years preceding his application have resided for not less than five years in His Majesty's Dominions (of which not less than one year ammediately preceding the application must have been spent in the United Kingdom) or have been for not less

than five years in the service of the Crown;
(b) be of good character and have an adequate knowledge of the English language; and

(c) intend to reside in His Majesty's Dominions or to enter or continue in the service of the Crown

Instructions for the guidance of persons desiring to apply for a Certificate of Naturalization are supplied with the form of application for a certificate which may be obtained (price 6d.)

from H.M Stationery Office.

The fee payable to the Home Office in respect of the grant of a Certificate of Naturalization is fixed by the Government of the day, and is at present £10, of which £1 is payable on submission of the application and the remainder on the grant of the Certificate. The £1 payable on submission of the application is not returnable, whether or not a Certificate is granted.

N.B —In the case of a woman who was a British subject previously to her marriage to an alien, and whose husband has died or whose marriage has been dissolved, the above requirements, both as to residence and us to fee, are relaxed.

STATUS OF ALIENS —Property may be held by an alien in the same manner as by a naturalborn British subject, but the title to such property does not confer any right on an alien to hold real property out of the United Kingdom, or qualify him for any franchise.

Aliens are not entitled to be tried by a jury de mediciate lingua, but are triable in the same manner as if they were natural-born

ADMISSION, SUPERVISION AND DEPORTATION OF ALIENS.—Under the Aliens Order, 1980, any alien coming from outside the United Kingdom must obtain the leave of an Immigration Officer to land in the United Kingdom, and such leave

is refused in many cases, e.g., where the alien is without means, or (if he is seeking employment) without means, or if he is seeking employment is unable to produce a Permit issued by the Minister of Labour. Provision is also made (Article 6 of the Order) for the registration of resident aliens and (Article 12) for the deportation of aliens by order of the Secretary of State, which can be made on various grounds. The Aliens Order, 1920, was made under the Aliens Restriction Act, 1924, as amended and extended by the Aliens Restriction (Amendment) Act, 1919.

BUSINESS NAMES REGISTRATION.

REGISTRATION OF BUSINESS NAMES ACT, 1916. This Act received the Royal Assent on as Dec., rgr6, and its provisions were explained on pp. 44-4150 the rgsr "Whitaker." The Office of the Registrar of Business Names is at Somerset House, W.C. 2.

CERTIFICATES

OF BIRTHS, MARRIAGES, OR DEATHS.

England and Wales -Certificates of Births, Deaths, or Marriages can be obtained at the General Register Office, Somerset House, on payment of fees amounting to 3x, 7d., viz., xx. for search, 2x. 6d. for the certificate, and xd. for search, 28. 62. for the certificate, and 16. for the stamp affixed thereto. (When application is made by post the charges are 38. 16.) They can also be obtained from the registration officer having the legal custody of the register book containing the entry of which a certificate is required. Certificates of marriages in churches of the Church of England can also be obtained from the incumbent of the church in which the marriage took place.

Certificates at reduced rates can be obtained for the purposes of certain Acts of Parliament . for the purposes of certain Acts of Parliament-Friendly Societies Act, 1866, Birth or Death, 12.; Factory and Workshop Act, 1901, and for pur-poses of Elementary Education, Birth, 6d; Savings Banks Act, 1887, Birth, Death, or Mar-riage, 12.; National Insurance Acts, 1912 and 1913, Birth, 6d., Marriage, 12.; Industrial Assurance Companies Act, 1896, and Trade Unions Amendment Act, 1896, death of child under 10 years of age, 12., but only from the local Registers.

English Registers—Birth registration exists at somerset House from 1837. An index to 2,000,000 earlier entries can be consulted at the Society

of Genealogists at 5 Bloomsbury Square, London, W.C. r. W.C. x.

Scottish Registers of Births, Marriages, and

Deaths.—Parish registers were instituted for
these in x5x, but until the Registration of
Births, &c. (Scotland), Act, x8x4, they were not
properly kept in many cases. Extracts may,
however, be obtained from them on payment of
ss. xd. for each entry, but to be valid evidence it
must be shown that the registers from which
the entries are taken were regularly kept.
Lists of the old parish registers may be consulted in the offices of the Registrar-General,
H.M. General Register House, Edinburgh, or of
local Registrars These old registers are in the local Registrars These old registers are in the charge of the Registrar-General, and since 1854 local registers have been transmitted to him at registers may be been transmitted to find a stated periods. Registers up to the end of 1910 are now in his possession. There is a general index to the registers which may be searched on payment of 26. A search of the index of a payment of 22. A fee of sos, is payable for search of all the Scottish registers, and zs. is payable for a search of a particular parish.

An extract of an entry may be obtained on payment of as. id. The office of the Registrar-General is open on weekdays between ze a.m. and 4 p.m.

COPYRIGHT.

The law of copyright is contained in the Copyright Act, xexx, under which copyright subsists automatically, without registration, in every original literary, dramatic, musical and artistic work. The provisions of the Act were explained on pp. 43-436 of the rags "WHITAKER."

Registration at Stationers' Hall under the

Registration at scanners ricu under one Copyright Act of 1842 terminated on Dec. 31, 1933, and in the following year the Stationers Company established a new Register m which Books and Fine Arts can be registered. A copy has to be filed at Stationers' Hall and certified copies of the entries are issued, the fees being 58 for a Book, and as. 6d. for Fine Art; certified copies gs. in either case. (Office open on Wednesdays only, ir a.m. to is noon, and s to 4 p.m.) Such entries are of value in proving the existence of a work on a given date in the case of infringement.

DAYS OF GRACE.

Bills of Exchange or Promissory Notes, pay-Bills of Exchange or Promissory Notes, payable at any time after date, have three days of grace allowed; thus, a bill dated x Jan. at two months' date is not due until March 4. If a bill or note is payable by instalments to be paid "punctually," this does not exclude the days of grace (Schaueren v. Morris, 37 T.L.R. 366). Bills drawn at sight, or on demand, must be paid on presentation without days of grace. In the United Kingdom, bills falling due on Sunday are payable the previous Saturday, and in England and Wales and in Ireland bills falling due on Good Friday or Christmas Day are simidue on Good Friday or Christmas Day are simi-larly payable on the previous day. Bills falling due on Bank Hohdays are payable the day after.

(For Certificates, see previous col.)

In England and Wales - When a death takes place, personal information of it must be given to the local Registrar of Births and Deaths, and the register signed in his presence, by one of the following persons.—r A relative of the deceased present at the death, or in attendance during the last illness. If they fail, a Some other relative of the deceased. In default of or, the occupier of the house in which the death; or, the occupier of the house in which the death happened. If all the above-named fail, 4. An innate of the house, or, the person causing the body to be buried. Relatives present or in attendance are first required to attend to the registration. The registration must be made within five days of the death, or within the same time written notice of the death sent to the Registrar, accompanied by a certificate of the cause of death, signed by a registered medical practitioner, if any such attended the deceased during his last illness. If notice is sent, information must nevertheless be given and the register signed within fourteen days from the death. It is important that every death should be registered and a certificate obtained before the funeral and delivered to the cannot remove the funeral and delivered to the funeral or religious service. If at the end of fourteen days the death is not registered, the Regastrar may require any one of the 'shovementioned persons to attend to register at a stated time and place. Failure to comply involves a penalty of forty shillings. The registration of a death is free of charge when it takes place within the above-mentioned periods. unless the Registrar is requested to attend at a residence, when a fee of one shilling is payable.

After twelve months no death can be registered without the Registrar-General's consent and on

payment of fees amounting to ten shillings.

A body must not be disposed of until (s) either the Registrar has given a certificate to the effect that he has registered the death, or (a) until the Coroner has made a disposal order.
(Births and Deaths Registration Act. 1926, 88 1, 2).

(Births and Deaths Regustration Act, 2926, 28: 1, 2). A person disposing of a body must within ninety-six hours deliver to the Registrar a notification as to the date, place, and means of the disposal of the body (tb. 2, 2). "Still-horn" child. (See under Births (Registration), p. 1935).

Death at Sea.—The master of a British ship must record any death on beard and search on the still ship of the still sh

must record any death on board and send particulars to the Registrat-General of Shipping.

Death Abroad — Consular Officers are autho-

rised to register deaths of British subjects occurring in their districts.

occurring in their districts.

In Soutland, the rules of registration are similar, but (1) the death must be registered within 8 days, (2) the medical man concerned must give a certificate of death to the Registrar in terms of the Registration of Births, &c. (8cotland) Act, 1842, within 7 days; (3) the informant of a death receives from the Registrar informant of a cash receives from the acquisition a certificate that the death has been registered. This is given to the undertaker, who delivers it to the keeper of the cemetery. Failure to com-

ply is under penalty in all cases. CORONERS' INQUESTS.—Corone CORONERS' INQUESTS.—Coroners' inquests are held in cases of violent and unnatural deaths. such as the case of a person slam or drowned, or dying suddenly, and of any person dying in prison. Coroners do not obtrude into the houses of persons for the purpose of holding inquests, but are sent for by the peace officers, to whom it is the duty of those in whose houses violent or unnatural deaths occur to make immediate communication, whilst the body remains in the same situation as when the death occurred. Inquests are not to be held on Sunday. With a view to avoiding duplication of proceedings it is now provided that if some person has been charged before examining Justices with murder, manulaughter or infauticide, the Coroner shall adjourn his inquest until after conclusion of the criminal proceedings (Act of 1926, 8. 20). On application by the Attorney-General the High Court may order a new inquest if the interests of justice so require. A jury is only essential in the five cases specified in the Coroners (Amendment) Act, 1906, but may be summoned in any other case if the Coroner thinks fit. The jury is to be composed of not more than rr nor less than 7 "good and lawful men" (sex disqualification now removed). If the minority is not more than two the Coroner may accept the verdict of the majority of the jary. The jury is usually summoned from the householders residing in the neighbourhood in which the death took place. Any person summoned as a usiness is bound to attend. The fine for defaulting juryssen or witness is any sum not exceeding &s. (See, generally, the Coreners Act, 1897, and the Coreners (Amendment) Act, 1996.) The jury is usually summoned from the

cases of sudden death a private inquiry is held by she Procurator Fiscal & Crown official who is the Public Prosecutor in criminal cases in every County, see p. sgg). The result of such inquiry is reported to the Lord Advocate. In the case of a death occurring in the course of anl industrial employment, and in every case in which the Lord Advocate may so order, a public inquiry is held before the Sheriff and a jury.

RURIATE.

The duty of burial is incumbent on the deceased person's Executors (if any appointed); it is also a recognized obligation of the husband of a woman, and the parent of a child, also of a householder where the body lies. Funeral expenses of a reasonable amount will be repayable out of deceased's estate in priority to any other claims. Directions as to place and mode of burial are frequently contained in the de-ceased s will, or in some memorandum placed with private papers, or may have been commuwith private papers, or may have been consuminated verbally to a relative. Consequently steps should be immediately taken to ascertain the deceased's wishes from the above sources. If Cremation is desired it is advisable for deceased to leave instructions in writing to that effect. Cremation may not take place if de-ceased has prohibited that form of burial. Under the Cremation Act, 1902, regulations have been made by the Home Secretary dealing fully with the cremation of a body, disposal of ashes, etc., and containing numerous essential safe-guards. A person may legally leave directions for the anatomical examination of his body. As to place of bunial—unless closed by order in Council—the parish churchyard is the normal burying place for parishloners, or any person dying in the Parish, but this will only nowadays apply in villages and the smaller towns. the more populous districts cometeries have long been established either by the local coun-cil, or a private company, and burials will take place there in accordance with the Cemetery Regulations. For an exclusive right to a burial Regulations. For an exclusive right to a burnar space in the churchyard a faculty is required from the Ecclesiastical Court. Poor persons may be buried at the public expense by a County Council or County Borough Council; and as to place of burial, &c., see Poor Law Act, sage, as. 75 to 76. A person being found drowned on the see shore is to be buried by the Overseers of the Parish. As to the necessity for registration of a death before burial see Notes under Deaths, p. 257.

DIVORCE.

Preliminary —Matrimonial suits may be conveniently divided into three classes, viz. (x) those in which a declaration against marriage is sought; (a) those in which the marriage is sought to be upheld; and (3) those in which, the marriage being admitted, partial or com-plete divorce is sought.

(z) Nullsty of Marriage.—Marriage is void ab instro if the parties were in the prohibited degrees of affinity, if it was bigamous, if there was no consent, if one of the parties was insane, or if one of the parties was under the age of consent, i.e. z6—Age of Marriage May, 1989. Inability to consummate a marriage may also be a ground for avoiding it. In such a case a decree of nullity may be obtained.

(a) Restruction of Conyuges Rights.—This is a In Sectional there is no Coroner. In ordinary form of relief generally sought by a spouse who

has been deserted. Disobedience to a decree of restitution of conjugal rights, although two years have not elapsed, at once constitutes desertion; and such desertion, if coupled with the husband's adultery, whether committed before or after the decree of restitution, is a ground for granting to the wife a decree of dissolution of marriage.

(3) Judicial Separation and Divorce. — The third class of suit includes the suit for judicial separation (which does not dissolve a marriage), and the suit for divorce proper (which, if successful, dissolves the marriage contract altogether and leaves the parties at liberty to marry again). and leaves the parties at nerty to marry again.

Either spouse may petition for judical separation on the ground of adultery, or cruelty, or of desertion without cause for two years or upwards. In such a petition a husband may claim damages from the co-respondent. A decree of judicial separation is often made the ground of a petition for divorce A petitioner who has committed adultery which has not been condoned cannot obtain a judicial separation or a decree of restitution of conjugal rights unless there has been condonation. The fact that a petitioner has been guilty of cruelty or desertion does not, however, debar him from a decree of judicial separation on the ground of adultery unless his conduct has conduced to the adultery.

Dicorce.-Where partial or complete divorce is sought, relief can only be obtained upon proof of certain offences which fall under two heads, namely (x) those which are offences under ecclesiastical law, e.g., cruelty, adultery, and unnatural offences; (a) those which are offences by statute, e.g., incestuous adultery, bigamy

with adultery, rape, and desertion.

If a husband seeks divorce, it is sufficient for him to prove the wife's adultery, in which case he may obtain damages from the adulterer. In the case of a wife it was formerly not sufficient that she prove mere adultery; but now, by an Act which came into force on July 18, 1923, she may petition for divorce on the ground that, since the mariage and the passing of the Act, her husband has been guilty of adultery. A wife can also obtain divorce if the husband has been guilty of bigainy with adultery, or rape or certain other criminal offences, or of adultery coupled with such cruelty as without adultery would have entitled her to a divorce desertion. "Cruelty" is conduct of such a character as to have caused damage to life, limb, or health (bodily or mental), or as to give rise to a reasonable apprehension of such danger. It is cruelty wilfully and recklessly to communicate a venereal disease : and a course of conduct calculated to break the spirit of the sufferer (generally the wife), continued until health breaks down or is likely to break down under the strain, is also a ground for relief.

If a wife gives birth to a child of which her husband could not possibly be the father, that is

sufficient proof of adultery.

It is desertion in the legal sense if one party to a marriage, without the consent or against the will of the other, wilfully without cause or reasonable excuse makes the other live apart for two years or more. It is, however, a question of intention. Powell v. Powell (1922) para 278. Formerly the only remedy for desertion was a suit for the restitution of conjugal rights: but now desertion without cause may enable the

descreed spouse to obtain a degree of judicial separation, and if coupled with adultery, a

divorce.

When the decree will be refused.—A decree must be refused, even if the suit is undefended, if the allegations in the petition for divorce are not proved. There is no such thing in the Divorce Court as judgment by default. Other absolute bars to relief are (i) combinance at the adultery of the respondent; (ii) collusion, as where the initiation of the suit is procured by agreement or bargain (but this does not prevent a fresh suit being brought free from collusion); (iii) condonation, i.e. complete forgiveness which restores the status quo. Forgiveness, without restoration of the wife to her former position, cannot amount to condonation. (Crocker

v Crocker (1921), P. 15) There are also certain discretionary bars, as, e.g. where the petitioner has been guilty of unreasonable delay, or has been guilty of such wilful neglect or misconduct

as has conduced to the adultery.

Intervention by King's Proctor.—At any time during the progress of a suit for dissolution or nullity of marriage, and before the decree near is made absolute, the King's Proctor may intervene to show cause against making a decree absolute.

Decree Absolute .- Every decree of dissolution or nullity is in the first instance a decree nisi. and is not made absolute until the expiration of six calendar months. The marriage subsists until the decree is made absolute. After that date either spouse may marry again; but a man may not marry the sister of his divorced wife whilst the divorced wife is alive. A divorced wife may call herself by her late husband's name. Persons who have been divorced may

re-marry.

Children.—When a suit has been commenced, the children should not be removed from the person in whose custody they are at the time. Derson in whose custody shop as a surface until a suit for judicial separation, nullity, or dissolution of marriage has been dismissed, the Court may make orders for the custody, maintenance, and education of children. Either spouse may make applications for access to the children.

Almony,-A wife may in any cause file a petition for alimony (i.e., means of support) pending suit, provided evidence of the marriage is adduced. The right to alimony continues until there is a decision against the wife in the court of first instance. The amount may be agreed between the parties, otherwise onefifth of the joint incomes is generally allowed. An order for permanent almony may be obtained by a wife who has obtained a final decree of judicial separation.

Protection Orders —A deserted wife may apply to a court of petty sessions or to the Divorce Division for an order to protect any money which has come to her after such desertion against her husband and his creditors. Disobedience to the order renders a party retaining the property hable to restore it and to pay twice the value thereof.

Costs.—Where a sunt is about to be set down for hearing, the wife, if she has not sufficient separate estate, may obtain payment from her husband of a sum sufficient to cover her costs to date; and where a decree has been obtained against her for judicial separation on the ground of adultery, she may defend herself at his expense should he afterwards bring a suit for dissolution of marriage. If a suit be decided dissolution of marriage. It is suit to decided against a wife who has separate estate, she may be condemned in costs. A co-respondent may be ordered to pay the whole or any part of the costs of the proceedings.

SEPARATION BY AGREEMENT.

SEPARATION BY AGREEMENT.
Husband and wife may agree, with or without consideration, to separate and live apart, but the agreement, to be valid, must be followed by an immediate separation. Although usually made by deed, a mere oral agreement is binding. If made, however, with a view to facilitating divorce proceedings it is void. A wife is not bound by a separation agreement if she was forced to make it by threats of violence. A clause which binds the husband to give up the custody of the children will be enforced unless the Court, is of oration nushand to give up the custody of the charten will be enforced, unless the Court is of opinion that it is not for their benefit. The agreement usually contains mutual covenants not to sue for the restitution of conjugal rights—a covenant by the husband not to molest the wife, and a covenant by the wife or her trustee to indemnify the husband against debts contracted by her during the separation. The remedy for a breach of the agreement is specific performance.

SUMMARY JURISDICTION.

When a husband has been guilty of assault or has deserted his wife, or has been guilty of per-sistent cruelty, or of wilful neglect to maintain her or her infant children, or where he is an habitual drunkaid, the wife may obtain relief from a Court of Summary Jurisdiction, By an Act which came into force on Sept. 30, 1925, the following grounds for an application were added to those already existing (a) cruelty to her children, (b) that her husband insists on having marital relations while suffering from a veneral disease, (c) that he has compelled her to submit herself to prostitution. A husband may apply on the ground that the wife has been cruel to his children. Relief may also be obtained by a husband whose wife is an habitual drunkard. The Court may where is an abstual drunkard. The Court may declare that the applicant is no longer bound to cohabit with the other spouse. Where a wife is the applicant, the legal custody of children under sixteen may be given to her, and the hisband may be ordered to pay a weekly sum not exceeding £s. Where the husband applies, the custody of all the children of the marriage may be given to him and the wife way be given to him and the wife way be corn. may be given to him, and the wife may be com-mitted to an inebriates home. If the wife has been guilty of adultery, no order will be made on her application unless there was condonation; and if, having obtained an order she commits adultery, the order may be discharged, but not if the court is of opinion that the husband conduced to the adultery by failing to make payment of the separation allowances. An order may be altered, varied or discharged at any time on cause being shown. All applications for relief must be made within six months of the ground of complaint.

DOMESTIC SERVANTS

" Domestic Servant" signifies, in law, a per-"Domestic Servant" signifies, in law, a person employed in and about a residence, e.g., cook, butler, gardener, &c., but does not include, e.g., a governess or tutor. By general custom, one calendar month's notice, given at any time on either side, is required to terminate the contract of domestic service, but the Courts have recognized a custom for termination at the end of the first month if notice is given at the end of the first fortnight.

end of the first fortnight.

Dismissed without notice is justified in the event of wilful disobedience to a reasonable order, gross misconduct, dishonesty, incompetence, or permanent incapacity. A "character," however unfavourable, is a privileged statement, so long as given without malicious intent.

The Workmen's Compensation Acts impose serious liabilities upon an employer in the event of death or disablement of a servant from an accident in the course of employment, and prudent employers will protect themselves by Policy, which can be obtained through the leading Insurance Companies for a small annual premium.

THE FRANCHISE.

The Representation of the People (Equal Franchise) Act, 1928, considerably amended both the qualifications for the franchise and the mode of registration of electors, and assimilated the franchises for men and women both for Parliamentary and Local Government elections.

PARLIAMENTARY.

The qualifications for the franchise are now the same for men and women. A person is entitled to be registered as a Parliamentary elector who is an years of age, and not subject to any legal incapacity; and

(a) Has the requisite residence qualification ; or (b) has the requisite business premises qualifi-cation; or (c) is the husband or wife of a person having a business premises qualification. Residence is the actual inhabitancy of premises,

i.e., where a person's home is and where he sleeps. The residence must have been during the whole of the qualifying period, i.e., three months, in the constituency or in another constituency in the same Parliamentary borough or Parliamentary county. If not, it is essential that the residence should have been successive from a Parliamentary borough or Parliamentary county contiguous to that borough or county. The Administrative County of London is treated as a Parliamentary borough.

Buriness premises means land or other premises of at least & to yearly value. The business premises must be occupied for the purpose of the business, profession, or trade of the person to

be registered.

Universities.—A person of full age, and not subject to any legal incapacity, who has received a degree, is entitled to be registered as a Parliamentary elector for a University constituency; also a woman who has passed the final examination and fulfilled the conditions required of women by a University which did not at the tune the examination was passed admit women to degrees

LOCAL GOVERNMENT.

The qualifications for the Local Government franchise are now the same for men and women. A person is entitled to be registered as a Local A person is entitled to be registered as a Local Government elector who is at years of age, and not subject to any legal incapacity; and (a) is on the last day of the qualifying persod occupying as comer or tenant land or premises in the electoral area; and (b) has during the whole of the qualifying period occupied as corner or tenant any land or premises in that area; if that area is not an administrative County or a County however them in any administrative. County borough, then in any administrative

Legal Notes-Voters' Qualifications-Registration-Illegitimacy, 261

County or County borough in which the area is situate; or (c) is the husband or wife of a person who is entitled to be registered in respect of premises in which the person entitled, and the husband or wife reside. There is also a service qualification for the local Government franchise. A person (man or woman) who inhabits any dwelling-house by virtue of any office, service or employment is deemed to occupy the dwelling house as tenant and so obtains the Local Government franchise provided the dwelling house is not inhabited by the employer.

REGISTRATION.

Each parliamentary borough and Parliamentary county is an electoral registration area, and for each registration area there is a Registration Officer. Normally, the Town Clerk is the Registration Officer for the Parliamentary Borough and the Clerk to the County Council for the Parliamentary County. It is the duty of the Registration Officer to compile the register of all persons entitled to vote as parliamentary electors or local government electors in his area. It is also his duty to comply with any directions given by the Secretary of State as to the arrangements to be made by the Registration Officer in carry-

ing out the registration.
The electoral lists when prepared are published by the Registration Officer. A copy can always be inspected at his office, and generally at the chief post offices and other convenient places in the ares, including Ciurch Porches, Public Libraries, and Local Council Offices The lists should be examined to see if the entries have been correctly made. If not, claims and objections may be made as by notice directed

The Index letters showing the nature of the qualifications of an elector are :-

R = Residence qualification.

B = Business premises qualification.

O = Occupation qualification.

D = Qualification through wife's occupation.

NM = Naval or military voter.

FOR WOMEN.

Rw = Residence qualification. Bw = Business premises qualification,

Ow = Occupation qualification

Dw = Qualification through husband's occupation

RIGHT TO VOTE.

Every person registered as a parliamentary elector is entitled to vote at an election of a member to serve in Parliament. But at a General Rection a person shall not vote for more than one constituency for which he or she is registered by virtue of a residence qualification, or for more than one constituency for which he or she is registered by virtue of other qualifications of any kind; which means that a person (man or woman) may, if qualified, law-fully vote twice at a General Election, but one vote must be in respect of a residence qualifica-tion, and each vote must be recorded in a different constituency.

ILLEGITIMACY AND LEGITIMATION. ENGLAND AND WALES.

A man may be summoned to petty sessions on the application of the mother of a bastard child, or by the Guardians of the Poor where the child

and the Justices, on his being proved to be the father of the child, may make an order requiring him to pay for its maintenance and education a sum not exceeding sos, a week. The mother has the custody of her bastard children. No person is required as father of an illegitimate child to give information concerning the birth of such child, and the registrar is forbidden to enter in the register the name of any person as father of the register the mame of any person as the child unless at the joint request of the mother and father. Such person is in that case required to sign the register, together with the mother. An unmarried domestic servant found to be encernte may be peremptorily dismissed without notice; but any attempt to examine without her consent a servant supposed to be encerate renders the employer liable to an action.

LEGITIMATION.—By the Legitimacy Act, 1926, which came into force on Jan. z, 1927, where the parents of an illegitimate person marry or have married whether before or after that date, the marriage, if the father is at the date thereof domiciled in England or Wales, renders 10 months in Engine of Water, fonders that person, if hving, legitimate as from Jan. 1, 1927, or from the date of the marriage, which ever last happens This does not legitimate a person whose father or mother was married to a third person at the time when the illegitimate person was born

How to Secure Legitimacy - A person claiming that he, his parent, or any remoter ancestor has become legitimated, may petition the High Court under the Legitimacy Declaration Act, 1858, or the County Court for the necessary declaration.

Rights of Legitimated Persons to take Interest in Property.—A legitimated person may take property under an intestacy occurring after the date of legitimation, or under any disposition (e.g. a will) coming into operation after such date, as if he had been legitimate.

Rights and Duties of Legitimated Person .- He must maintain all persons whom he would be bound to maintain had he been born legitimate, and he is entitled to the benefit of any Act of Parliament which confers rights on legitimate persons to recover damages or compensation. The Act specially provides that nothing therein contained is to render any person capable of succeeding to or transmitting a right to any dignity or title.

Persons Legitimated by Extraneous Law -Broadly speaking, the Act provides that persons properly legitimated abroad shall be recognized as legitimated in England and Wales.

SCOTLAND.

Illegitimate Children (Scotland) Act, 1930.— The mother of an illegitimate child may obtain a decree of affiliation and aliment against the father. The process may be raised either in the Court of Session or the Sheriff Court, but usually is in the Sheriff Court. Where in any action of affiliation and aliment the Court finds that the defender is the father of the child, the Court shall in awarding any sum in name of inlying expenses, or in name of aliment, have regard to the means of the pursuer and the defender, and the whole circumstances of the case. The court may, upon application by the mother or by the father of any illegitimate child, or in any action for aliment for an illegitimate child, make such becomes chargeable to the Union or Parish; order as it may think fit regarding the custody

of such child and the right of access thereto of either parent, having regard to the welfare of the child and to the conduct of the parents and to the wishes as well of the mother as of the father and may on the application of either parent recall or vary such order. The obligation of the mother and of the father of an illegitimate child to provide aliment for such child shall (without prejudice to any obligation attaching at common law) endure until the child attains

the age of sixteen years.

By Scots Law an illegitimate child is legitimated by the subsequent marriage of its parents provided there was no impediment to the marriage of the parents at the time of the conception of the child. Such legitimation is recognised by International Law so far as the laws of particular countries allow it. It is valid in England except that such a child cannot succeed to real estate in England on intestacy After the marriage of the parents such a child may be registered as legitimate by warrant of the Sheriff.

JURY SERVICE.

Preliminary.-The juries with which the public are most concerned are the grand juries; uries summoned to try causes in the High Court, at assizes and county courts; and those summoned to try criminal cases at assizes, the old Bailey, and counts of Quarter Sessions, and coroners junes

Qualifications .- All natural-born subjects of the King and aliens domiciled for ten years or more, being men or women between az and 65, are

liable to serve as jurors [
The sex disqualification was removed in 1919, and women are now liable to serve, but a judge may order that the jury shall be composed of men only or of women only, or may, on an application made by a woman, grant her exemption in respect of any case by reason of the nature of the evi-

of any case by reason of the nature of the evidence to be given or of the issues to be treed.

The qualification of a juro 1 sa property one—that is to say, he or she must be a person who owns property or pays rates. A householder or shopkeeper in the City of London who owns personal estate worth £roe; a resident in a county or borough owning £ro a year in real estate or reat charge, or £so in leaseholds, or a householder in a county or borough occupying account of the property of the prop property whose net annual value is assessed at not less than £30 a year in Middlesex and the County of London, or £30 in other counties, and occupiers of houses with not less than fifteen windows, are all compellable to serve as jurors

unless exempted or disqualified

Exemptions and Disqualifications — Aliens (subject as above), felous, lunatics, imbeciles, deaf or blind persons are disqualified from serv-Disqualifications - Aliens ing on juries, while the full wing classes of persons (amongst others) are exempt—peers, members and officers of both Houses of Parliament, clergymen and priests, ministers of any congregation of Protestant dissenters and Jews, whose meeting place is duly registered, judges, barristers, solictors (if practising), officers of the supreme court, magistrates, cierks of the peace, sheriffs' officers and servants of such officers, justices of the peace, members of local bodies, governors of prisons and gaolers, super-nitendents, &c. of lunatic asylums, doctors and pharmaceutical chemists (if actually practising), dentises, officers and men in Navy, Army, Air and Territorial Forces, licensed pilots, postal, custom and inland revenue servants.

Special examption.—A judge, and, by virtue of S. 3 of the Juries Act, 1922, the sheriff, may for good reason excuse attendance on any particular

ĩwy.

Jury Lists.—Lists of juries are now prepared in accordance with the Juries Act, 1922. the names of persons apparently qualified as Jurors being so marked on the Electors Lists (exhibited at Town Halls, Public Libraries, in church porches, &c.). Persons who deem them-selves to be entitled to be exempted should communicate with the registration officer, for all whose names appear on the Jury List as finally settled are liable to serve.

Grand Junius.—The function of the grand jury is to make presentments on oath to judicial hodies or personages, mainly of accusation against persons against whom criminal proceedings are pending. The jurors have to say in enecu whether there is a print facie case against the The jurors have to say in effect accused, against whom an indictment has been prepared, and if they are satisfied of this they find "a true bill", if not, they "ignore the bill" and the accused is discharged

Juries in Criminal and Civil cases. - An accused person against whom a true bill has been found is tried by a "jury sworn." A "panel" of jurors are summoned to attend the court on a particular day, and it is from amongst them that the jury who are to try the prisoners are selected at random (an interesting note on the selection of juvors will be found in Halsbury's Laws of England, Vol. 28, p. 246). In a criminal case the prisoner has a right of challenge which is of two kinds-a challenge to the arraythe whole number of jurors summoned (which is so rare that it need not be further considered) and a challenge to the poll, i.e., to individual purors, which may be peremptor; or for cause. Peremptory challenge, or challenge without cause, exists only as of right in treason and felony, and the prisoner can only challenge a limited number without reason. In the exercise of this right prisoners frequently object to the women on the jury. "Challenge for cause" sometimes takes place on the ground that the proposed juror is a peer or is alleged to have committed some crime which makes him ınfamous.

Except upon trials for murder, treason, and treason felony juries after being sworn may separate, e.g., for lunch and at night. The verdict must be given in open court in the presence of all the jurors, and in cases of treason and felony in the presence of the defendant. It must be unanimous, except that in civil cases the parties may agree to take a majority

Special Juries. - Special Jurors are selected Special Juries.— Special Jurors are selected from persons having larger property qualifications, e.g., the occupier of dwelling house in a large town rated at not less than \$zoo. Trial is generally by Common Jury, but in any cause or matter at Assizes or in the High Court an order for a Special Jury may be obtained in certain cases.

Payment of Jurors .- A Special Juror is enrayment of Surors.—A special Juror is entitled to a fee of one guines for each case in which he is sworn to act, whereas a Common Jury is only entitled to ze, on each cause tried in the High Court or a County Court; and on Circuit, 8d. In Criminal Cases the jury is entitled to and, in fact, receives nothing. At Inquests, held before Coroners, the jurors are entitled to such fee as the local authority may

permit the coroner to pay.

A juror is not accountable for, nor will any action lie against him, in respect of anything said or done by him in discharge of his office. If he fall to appear in the High Court or at assizes when duly summoned he may have to pay a fine of £10, while non-appearance at a county court may involve a fine of £5.

Coroners' Juries. - (See Deaths - Coroner's Inquests, page 258.)

LEGAL AID FOR THE POOR.

Civil Cases.

A system now exists for giving legal aid to poor persons in civil proceedings—including divorce—administered by the Law Society, Chancery Lane, W.C a, and through various Provincial Law Societies. Under this system committees water now established throughout England and Wales. Anyone desiring this form of aid may apply to the nearest "Poor Persons Committee" for a Poor Persons Certificate, and if this is granted a Solicitor and Counsel will be allotted to act without remuneration The Certificate can be given if the poor person is not worth £50 (excluding wearing apparel and trade tools) and the usual income does not exceed £2 a week In special circumstances above figures may be £100, and £4 a week. The Committee may require the poor person to deposit a sum not exceeding £5 (in the first instance) to cover out-of-pocket expenses of the conducting solicitoi.

Divorce proceedings under the Poor Persons system may be commenced at the Divorce Registry in London or in one of the numerous District Registrics in the Provinces now authorised for the purpose, and the trial or hearing may be in Loudon or at the Assizes at one of the many towns at which Divorce business may now be taken under the Rules of the Supreme Court.

Criminal Cases.

The Poor Prisoners Defence Act, 1930, provides for free legal aid in criminal proceedings in specified cases. On trial for an Indictable offence the person charged may have free legal aid, with Solicitor and Counsel, if Justices or Judge of trial court grant a Defence Certificate. If the person's means are insufficient, such Certificate may be granted in cases where desirable, and must be given for a murder charge. In Courts of Summary Jurisdiction, assuming manificient means, a Defence Certificate may be granted to a person if considered desirable to do so owing to gravity of charge or exceptional circumstances

Scotland.—In every town there are Solicitors for the Poor, and in the Count of Session there are Counsel for the Poor, all of whom act gratuitously. Any class of litigation may be gratuitously. Any class of litigation may be undertaken for poor persons, but the operation of the "Poor's Roll" is chiefly important in matrimonial and bastardy cases. Legal services are rendered free of charge, and no Court dues are payable. In cases of divorce application must be made to the Court of Session. In cases of separation simply, application may be made to the Sheriff Court. The means that preclude a person from the benefit of the Poor's Roll are not fixed, and each application depends on its own circumstances. The Poor's Roll was estabhahed in 1424.

WARRIAGES.

BY BANNS OR LICENCE.

BANNS OF MARRIAGE. - The Marriage Act a6 Geo. II. c. 32, prescribes audible publication according to the rubric, on three Sundays preceding the ceremony, after the Second Lesson. Where the parties reside in different parishes, the banns must be published in both, the minister giving his certificate of the same to be handed to the minuter of the parish where the marriage takes place. Under the Marriage Measure 1930, banus may be published and marriage solemnized in the parish church which is the usual place of worship of the persons to be married or either of them although neither of such persons dwells in such parish; but this publication of bauns is in addition to any other publication required by law. The law provides specially for the case where one of the parties resides in Scotland, the publication being then in the parish church. In like manner in Scotland the publication takes place in the partish church, in whatever church the parties are married. It may be noted that, by Scottish law only, omission to publish the banns does not invalidate the marriage, because it would still stand as an irregular marriage carried out by consent before witnesses (see sub-tit., "Marriages in Scotland," post). The names by which the parties are known are sufficient for publication of banns, so that a variance from the strict baptismal name is not important. But where wrong names are designedly given, for the purpose of concealment or otherwise, the case is different, and the marriage may be null and void (Midgeley v. Wood, 4 Sw. & Tr 267) Where a wrong and fraudulent name is given by one party only, and the other party is innocent, the validity of the marriage is not affected.

The Bishop may license a Chapel of Ease for the celebration of marnages, but where a district has been assigned to a chapel, and it becomes a vicariage, or "ecclesiastical parish," the option ceases, and the banus must be pro-claimed and marriage celebrated therein, and not in the "mother church" or that of the

civil parish
If three months be permitted to elapse from the last time of publication, the banns become useless, and the parties must either obtain a licence, or submit to the republication of banns The minister ought to satisfy himself that the parties are of full age, or that the consent of parents is obtained, and it is usually on the score of insufficiency of age that banns are "forbidden." By the Act 6 & 7 Will IV. c 85, a marriage may be performed in church on the supernatendent. registrar's certificate without banns, provided that the insumbent's consent is obtained. One of the parties must be resident within the Ecclesiastical parish of the church in which the marriage is to take place
